FLUIDWARE® APP

Configure and order bellhousings,
shaft couplings and accessories
– quickly and easily!

FLUIDWARE® APP is multilingual. In addition to German and English, the following languages are available:
French, Spanish, Italian, Dutch, Chinese, Russian and Turkish.

User registration/Log-in

Use the registration form to save your customer master data e.g. name, address, company and e-mail address; you will only need to enter your log-in name and password for fast and convenient access on all your subsequent visits. You can also select any of the available languages such as your standard setting. The web app has been tested on the five most frequently used browsers. When the app is running, you can see which browser is currently in use and which alternative browsers are also available.

The centrepiece – the configurator

The FLUIDWARE® APP configurator provides a drop-down-menu that allows you to individually configure the sub-assembly you need. The convenient auto-select feature integrated in the drop-down boxes means that finding the parameters you need is fast and easy. The web app automatically creates a drawing of the desired configuration in real time, giving you the added reassurance of an immediate visual check.

You can select metric or imperial dimensions – or both, if required – to be shown on your drawing. It is also possible to select either kW or horsepower (HP) as the unit of power.

Configurations

All previously used configurations can be selected using the “Configurations” button. They can be opened via Quick Navigation or with the Project Browser, so they are always readily available for reference, further processing or modification purposes. The Project Browser also provides an overview of all documents that have been created with the web app – sorted by document type. This means that users have their configurations, quotations and any related CAD files at their fingertips at all times, no matter whether they are on the road or in the office.

Product Pricing information

FLUIDWARE® APP enables registered customers to request the current individual prices for the configuration they have created. There is no longer any need to submit a request for quotation to the R+L HYDRAULICS sales department.

FLUIDWARE® APP

Practical: finished configuration = finished calculation!

The FLUIDWARE® APP enables users to calculate the cost of a sub-assembly – consisting of bellhousing, shaft coupling and accessories – as soon as it has been configured using the same app. The FLUIDWARE® APP is a single application that combines the functions of a classic configuration programme with additional features from the fields of design and sales.

The web can be used either as a classic desktop application or on the web browser of a tablet computer.

The platform-independent architecture and conscious orientation towards high online availability make the FLUIDWARE® APP the ideal tool for configuring and calculating the R+L product range – at the workplace or on the road.
