EO-Tubes and Pipes for fittings and flanges

Industrial and Mobile Applications
Marine and Offshore Applications

Parker

ENGINEERING YOUR SUCCESS.

For your safety!

Under certain circumstances, tubes, fittings and flanges can be subjected to extreme loadings such as vibration and uncontrolled pressure peaks.

Only by using genuine Parker components and following Parker assembly instructions you can be assured of the reliability and safety of the products and their conformity to the applicable standards.

Failure to follow this rule can adversely affect the functional safety and reliability of products, cause personal injury, property damage, and result in loss of your guarantee rights.

Subject to alteration

Tubes for fluid, hydraulic and pneumatic Applications

The world of tubes

Your choice for high pressure.

The tube programme from Parker Hannifin gives all possibilities for usage in hydraulic applications. Tubes for fitting- and flange-systems, tubes for mobile and stationary systems. Different dimensions, carbon- and stainless-steel tubes as well as different surfaces are available.

Approved quality.

Parker tubes are designed for the special requirements in several markets. Continuous tests in laboratories and on test benches ensure the high quality level of the material. Certifications from independent institutes such as ABS, LR or DNV confirm the adherence to high standards. This opens into reliability and longevity of the hydraulic application.

Worldwide connections.

The Parker Hannifin tube-warehouse with its worldwide network provides a close and prompt supply of high precision tubes; thus, international customers can also rely on us. Efficient, reliable, environmentally friendly and on-time deliveries are available in almost every country in the world.

All around tubes.

This brochure provides all relevant information regarding hydraulic lines in a structured and clear way. Which parameters are important, what kind of tubes and dimensions fit the construction and specifications, and which materials are in use in special applications. With Parker order codes you can start right away...

Certificates

On request our tubes & pipes have the relevant certificates for your markets. The suppliers are approved e.g. by ISO 9001, ISO/TS 16949, ISO 14001. Please ask for details.

Parker

Complete Piping Solutions and System Supplier

Added Value maximizes your performance

CPS - Complete Piping Solutions.

Just tubes! But it gets even better. Many customers like to have the complete Parker programme, and that's what we deliver worldwide based on our „Complete Piping Solutions"-concept. Technical support, reengineering, pre-fabrication, delivery and installation. These five steps give an effective and environmentally friendly solution from one source.

Our integrated knowledge, quality products, contemporary production methods and installation-experience guarantee perfect complete solutions for hydraulic systems. Integration in existing systems is also available. We help our customers right from their project start to highest productivity and timeliness.

Advantages as a system supplier.

Parker Hannifin is the world's leading diversified manufacturer of motion and control technology. The company offers a product portfolio that is exemplary in the breadth and depth, and in constantly keeping quality. Through an international distribution network, the components are delivered quickly.

System solutions are tailored to the customer's situation. Whether DIN or SAE and available anywhere in the world. It will match everything together with a system, and the global design production is nothing in the way to the last detail. Efficient, sustainable and progressive.

Tube and pipe specification

Recommended carbon steel tubes and pipes

Parker recommends the use of cold drawn seamless hydraulic tubes and pipes acc. to DIN EN 10305-4.
E 355N (St. 52.4 NBK) or E 235N (St. 37.4 NBK).

+ precision dimension/shape
+ high pressure capability
+ clean inside (no scale)
+ excellent scaling surface after roll flaring

Recommended stainless steel tubes and pipes

Parker recommends the use of seamless cold drawn stainless steel tubes and pipes acc. to
DIN EN 10216-5
ASTM A269/A213
ASTM A312

+ precision dimension/shape
+ high pressure capability
+ excellent scaling surface after roll flaring

Welded tubes and pipes

Tubes and pipes acc. to above specification but welded and cold redrawn instead of seamless drawn are usually suitable. Pressure capability might be reduced due to the welding seam zone.
Welding seam quality might effect roll flaring surface results.

Hot rolled pipes

Hot rolled pipes are not recommended for the following reasons:
Hot rolled pipes do not have precision dimensions and may slip in machine dies.
They have scales inside and outside. The inside scales effect the cleanliness level of the fluid and reduces fatigue levels. Used in roll flaring process the scales will contaminate the flaring tools (high cleaning effort) and cause poor flare surface quality.

The required maximum working pressure is calculated either acc. to DNV, DIN or ANSI.

Material Specifications & Values

1.0308 (E235/St.35.4) acc. to DIN EN 10305-4	
Tensile strength	min 340 N/mm²
Yield strength	min 235 N/mm²
Fatigue strength	225 N/mm² [1]
Elongation at break	min. 25%

1.0508 (E355/St.52.4) acc. to DIN EN 10305-4	
Tensile strength	min 490 N/mm²
Yield strength	min 355 N/mm²
Fatigue strength	265 N/mm²
Elongation at break	min. 22 %

1.4571 (316 Ti) cold drawn (CFA)[3] acc. to DIN EN 10216-5	
Tensile strength	min 500 N/mm²
0.2 % proof stress	min 210 N/mm²
1 % proof stress	min 245 N/mm²
Fatigue strength	220 N/mm²
Elongation at break	min. 35 %

1.4404 (316L) cold drawn (CFA)[3] acc. to DIN EN 10216-5	
Tensile strength	min 500 N/mm²
0.2 % proof stress	min 210 N/mm²
1 % proof stress	min 245 N/mm²
Elongation at break	min. 35 %

1.4401 (316) acc. to DIN EN 10216-5	
Tensile strength	min 510 N/mm²
0.2 % proof stress	min 205 N/mm²
1 % proof stress	min 240 N/mm²
Elongation at break	min. 40 %

1.4301 (304) acc. to DIN EN 10216-5	
Tensile strength	min 500 N/mm²
0.2 % proof stress	min 195 N/mm²
1 % proof stress	min 230 N/mm²
Fatigue strength	195 N/mm² [2]
Elongation at break	min. 40 %

1.4404 (316L) ASTM A269 / A213	
Tensile strength	min 530 N/mm²
Yield strength	min 276 N/mm²
0.2 % proof stress / 1.6 [4]	172.5 N/mm²

1.4404 (316L) ASTM A312 / A530	
Tensile strength	min 515 N/mm²
Yield strength	min 234 N/mm²
0.2 % proof stress / 1.6 [4]	146 N/mm²

[1] DIN 2413 Template, Tab. 4
[2] Rollof/Matek ME Ausg. 14, (no standard value)
[3] Strength increase due to cold forming following 1.4571
[4] Pressure rating calculation based on this mechanical properties require certification according to 3.1 - EN 10204 that confirmes the mechanical properties.

Tube calculation for marine and offshore acc. to DNV rules

Calculation of working pressure of steel and stainless steel tubes for ship building acc. to DNV Part 4, Chapter 6, Section 6.

$$P = \frac{20 \cdot \sigma_t \cdot e \cdot t_0}{D - t_0}$$

P = permissible working pressure [bar]
σ_t = permissible stress [N/mm²] calculated from the lower value off:

stainless steel: $\sigma_t = \frac{R_m}{2.7}$ or $\frac{K}{1.6}$

carbon steel: $\sigma_t = \frac{R_m}{2.7}$ or $\frac{K}{1.8}$

t_0 = tube wall thickness without allowences [mm]

$t_0 = t_n \cdot a - c - b$

t_n = tube wall thickness nominal [mm]
a = factor for wall thickness allowence [mm]
= 0.8 for Tube-OD 4-5, 0.85 for Tube-OD 6-8, 0.9 for Tube OD >=10
= 0.9 for all stainless steel tubes
b = bending allowence

$b = 0.1333 \cdot t_0$ (at R/D=3) $\rightarrow$ $t_0 = \frac{t_n \cdot a - c}{1.1333}$

c = corrosion tolerance, c = 0.3 mm for hydraulic steel tube, c = 0 mm for SS tubes
e = strength ratio: for seamless tubes e = 1
D = tube outside diameter [mm]
R_m = min. tensile strength [N/mm²]
K = min. yield strength or min 0.2% proof stress [N/mm²]

Tube calculation for landbased and industrial applications acc. to DIN rules

DIN 2413 I, only for static load

Calculation of working pressure of steel tubes for static stress up to 120°C. Corrosion – additional allowences are not considered for the calculation of pressures. Tubes with a diameter of OD/ID > 2 are calculated for static stress in accordance with DIN 2413 III, but with K = yield strength.

$$P = \frac{20 \cdot K \cdot s \cdot c}{S \cdot D}$$

P = permissible working pressure [bar]
K = yield strength [N/mm²]
s = tube wall thickness [mm]
c = factor for wall thickness allowance
= 0.8 for Tube-OD 4-5, 0.85 for Tube-OD 6-8, 0.9 for Tube-OD 10
= 0.9 for all stainless steel tubes
S = Safety factor = 1.5
D = tube outside diameter [mm]

DIN 2413 III, for dynamic load

Calculation of working pressure of steel tubes for dynamic stress up to 120°C.
Corrosion – additional allowences are not considered for the calculation of pressures.

$$P = \frac{20 \cdot K \cdot s \cdot c}{S \cdot (D + s \cdot c)}$$

P = permissible working pressure [bar]
K = fatigue strength [N/mm²]
s = tube wall thickness [mm]
c = factor for wall thickness allowance
= 0.8 for Tube-OD 4-5, 0.85 for Tube-OD 6-8, 0.9 for Tube-OD 10-80
= 0.9 for all stainless steel tubes
S = Safety factor = 1.5
D = tube outside diameter [mm]

Burst Pressure calculation

Calculation acc. to Formula of DIN 2413 but without safety

BP = Burst Pressure
Rm = min tensile strength
s = tube wall thickness
c = factor for wall thickness allowance
= 0.8 for Tube-OD 4-5,
0.85 for Tube-OD 6-8,
0.9 for Tube-OD 10
0.9 for all stainless steel tubes
D = tube outside diameter [mm]

$$BP = \frac{20 \cdot Rm \cdot s \cdot c}{D}$$

Pressure reductions and temperatures

Required pressure reductions (depending on the material) with reference to the catalogue pressures for higher temperatures. Both metal fitting material and elastomeric sealing compound have to be selected according to the temperature range of the system.
DNV may require different pressure reduction based on application

Material	Pressure reduction of permissable operating temperatures TB in °C														
	-60	-54	-40	-35	-25	+20	+50	+100	+120	+150	+175	+200	+250	+300	+400
Steel components			10%			0%				11%	19%				
Steel, tubes			10%			0%				19%			27%		
Stainless steel components	0%						5%	15%	23%		29%		33%	37%	42%
Stainless steel, tubes	0%						5.5%	11.5%	21.5%				29%		34%
Sealing material NBR (e.g. Perbunan)															
Sealing material FKM															
Sealing material Polyurethan (P5008)															

Permissible operating temperature
Ambient temperature of hydraulic and pneumatic applications
Temperature not permissible

Calculation example:
Temperature = 200°C
Material = Stainless steel
Pressure reduction = 29%
Pressure reduction tubes = 21.5%
PN tube 16x2.5/71. DIN2413 III = 362 bar

Formula:

$$PN_{200°C} = \frac{400\ \text{bar}}{100\%} \times (100\% - 29\%) = 284\ \text{bar}$$

$$PN_{\text{tube } 200°C} = \frac{362\ \text{bar}}{100\%} \times (100\% - 21.5\%) = 284\ \text{bar}$$

Flow diameter of tube lines

Determining tube sizes for hydraulic systems

Proper tube material, type and size for a given application and type of fitting are critical for efficient and trouble-free operation of the fluid system. Selection of proper tubing involves choosing the right tube material, and determining the optimum tube size (O.D. and wall thickness).
Proper sizing of the tube for various parts of a hydraulic system results in an optimum combination of efficient and cost effective performance.
A tube that is too small causes high fluid velocity, which has many detrimental effects. In pressure lines, it causes high friction losses and turbulence, both resulting in high pressure drops and heat generation. High heat accelerates wear in moving parts and rapid aging of seals and hoses, all resulting in reduced component life. High heat generation also means wasted energy, and hence, low efficiency.
Too large tubes increase system cost. Thus, optimum tube sizing is very critical. The following is a simple procedure for sizing tubes.

Determine required flow diameter
Use table to determine recommended flow diameter for the required flow rate and type of line.

The table is based on the following recommended flow rates that are common in the shipbuilding and offshore engineering:

$$\text{Pressure lines} - 3 \rightarrow 7.2 \left[\frac{\text{m}}{\text{s}}\right]$$

$$\text{Return lines} - 2 \rightarrow 4.5 \left[\frac{\text{m}}{\text{s}}\right]$$

$$\text{Suction lines} - 1 \rightarrow 1.8 \left[\frac{\text{m}}{\text{s}}\right]$$

Avoid flow rates > 8 m/s!
The resulting forces are high and can destroy the tube lines.

If you desire to use different velocities than the above, use the following formula to determine the required flow diameter.

$$\text{Tube – I.D. [mm]} = 4{,}61 \times \sqrt{\frac{\text{Flow } \left[\frac{\text{ltr.}}{\text{min}}\right]}{\text{Velocity } \left[\frac{\text{m}}{\text{s}}\right]}}$$

Determine required wall thickness

Use tube/pressure calculation tables shown in the tube chapter to determine recommended wall thickness for the required working pressure and flow diameter of the line. Therefore choose a working pressure which is equal or higher than the required working pressure.

Flow characteristics

Hydraulic systems are in most cases only rated with a flow velocity defined on the basis of experience. The pressure losses in lines are not taken into account, or measured later on when testing the system. As the pressure losses increase porportionally greater than the flow resistance, it is important to achieve the best rating of the system, so that they are already taken into account when planning the tube connections. Calculation is not as difficult as it is often thought, and this chapter is intended to provide a guideline. Besides, it provides information on how excessive pressure losses can be avoided, because pressure losses result in losses in performance and excessive heat. Noise occurs and possibly cavitation in suction lines.

Medium

All indication given with regard to flow restrictions and to flow properties refer exclusively to liquids. For gaseous media, the variable density of the gas must additionally be taken into account.

Units

c = Flow velocity $\left[\frac{m}{s}\right]$

d = Pipe inside diameter [m]

L = Pipe length [m]

p = Pressure [Pa], 1 bar = 100000 Pa

$\dot{V}$ = Flow rate $\left[\frac{m^3}{s}\right]$, $1\ \frac{m^3}{s} = 6000\ \frac{l}{min}$

λ = Pipe friction factor

$\upsilon(T)$ = Kinematic viscosity of the medium depending on temperature $\left[\frac{m^2}{s}\right]$

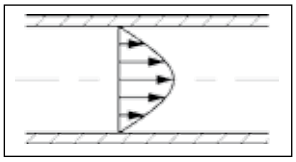
$\rho(T)$ = Density of the medium depending on temperature $\left[\frac{kg}{m^3}\right]$

ζ = Individual pressure loss coefficient

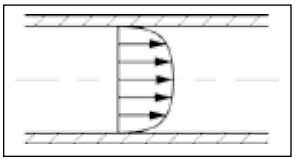
Only base units have been used. This has the advantage that the formula do not contain correction factors and there is no danger of confusion, e.g. that values are used with the wrong unit. In case values are given in other units – the flow rate is e.g. often given in l/min – it is advisable to convert them into the base units before starting calculation.

Pressure losses in pipe lines

To calculate pressure losses in pipe lines, it must first be determined whether there is a laminar or a turbulent flow. Laminar flow is homogenous and without turbulence. In case of turbulent flow, the losses increase much more quickly.



Flow profile with laminar flow



Flow profile with turbulent flow

The kind of flow is defined by the Reynolds' number. With a Reynolds' number of more than 2320, the flow changes to turbulent. The Reynolds' number is calculated according to the formula:

$$Re = \frac{c \cdot d}{\upsilon(T)}$$

The Reynolds' number is a non-dimensional number. The critical fluid velocity at which the flow regime can change, is thus calculated from:

$$c_{cr} = 2320 \cdot \frac{\upsilon(T)}{d} \left[\frac{m}{s}\right]$$

With a given flow rate, the fluid velocity can be calculated according to the formula:

$$c = \frac{\dot{V} \cdot 4}{d^2 \cdot \pi} \left[\frac{m}{s}\right]$$

Subsequently, the pipe friction factor λ can be calculated. The pipe friction factor λ is a function of the Reynolds' number and also depends on the roughness of the pipe. As hydraulically smooth pipes can generally be assumed in hydraulic applications, the pipe friction factor λ is calculated according to the following formula:

$$\text{laminar flow, } (Re < 2320): \lambda = \frac{64}{Re}$$

$$\textit{turbulent flow, } (Re > 2320): \lambda = \frac{0.3164}{\sqrt[4]{Re}}$$

Finally, if all factors are known, the pressure loss in a certain pipe line can be calculated according to the formula:

$$\Delta p = \lambda \cdot \frac{L}{d} \cdot \frac{\rho(T) \cdot c^2}{2} \text{ [Pa]}$$

Calculation of individual losses

A hydraulic system does not only incorporate pipes, but also valves, fittings, pipe bends etc. that cause flow losses. These individual losses are often much higher than the pipe losses and are calculated according to the following formula:

$$\Delta p = \zeta \cdot \rho(T) \cdot \frac{c^2}{2} \text{ [Pa]}$$

Oil flow and pressure loss

All calculations based on Tube acc. to EN 10305-4, viscosity 37sct. specific gravity 0.860.
Following formula used and to determine other required tube or pipe sizes:

$$\text{Tube/Pipe I.D.: } = 4.61 \times \sqrt{\frac{\text{flow/min}}{\text{velocity m/s}}}$$

	Oil flow capacity l/min			Pressure loss in tube bar/m

Seamless EO steel tubes (continued) | Material E235N (St. 37.4)

Tolerance DIN EN 10305-4

1 Design pressure bar Values calculated for straight length.
Tubes with a diameter of OD/ID>2 are calculated for static stress in accordance with DIN 2413 III but with K=yield strength.
2 Evaluated in Parker Lab and Test Field.

Surface finish:
- Phosphated and oiled:
- Tubes with I.D. 1.5–5 mm: outside and inside oiled.
- Tubes from 6 mm I.D.: outside and inside phosphated and oiled.
- Cr(VI)-free:
  These dimensions are externally thick coat passivated (thickness of coat 8–12 µm), inside oiled.

Seamless EO steel tubes | Material Carbon-Steel

for hydraulic and pneumatic pressure lines.
SAE J 524. C-Steel, surface phosphated and oiled.
Test according ASTM A 179-90 A/ASME SA 179.
Quality and leak tested.

1 Design pressure bar Values calculated for straight length.
Tubes with a diameter of OD/ID>2 are calculated for static stress in accordance with DIN 2413 III but with K=yield strength.
2 Evaluated in Parker Lab and Test Field.

Notes

Parker's Motion & Control Technologies

At Parker, we're guided by a relentless drive to help our customers become more productive and achieve higher levels of profitability by engineering the best systems for their requirements. It means looking at customer applications from many angles to find new ways to create value. Whatever the motion and control technology need, Parker has the experience, breadth of product and global reach to consistently deliver. No company knows more about motion and control technology than Parker. For further info call 00800 27 27 5374
