

# Turcon® Variseal®

## Your Partner for Sealing Technology

Trelleborg Sealing Solutions is a major international developer, manufacturer and supplier of seals, bearings and molded components in polymers. We are uniquely placed to offer dedicated design and development from our market-leading product and material portfolio: a one-stop-shop providing the best in elastomer, silicone, thermoplastic, PTFE and composite technologies for applications in aerospace, industrial and automotive industries.

With 50 years of experience, Trelleborg Sealing Solutions engineers support customers with design, prototyping, production, test and installation using state-of-the-art design tools. An international network of over 70 facilities worldwide includes over 20 manufacturing sites, strategically-positioned research and development centers, including materials and development laboratories and locations specializing in design and applications.

Developing and formulating materials in-house, we utilize the resource of our material database, including over 2,000

proprietary compounds and a range of unique products. Trelleborg Sealing Solutions fulfills challenging service requirements, supplying standard parts in volume or a single custom-manufactured component, through our integrated logistical support, which effectively delivers over 40,000 sealing products to customers worldwide.

Trelleborg Sealing Solutions facilities are certified according to current market-related quality standards. In addition to the established ISO 9001 standard, our facilities are certified to environmental, health and safety standards, as well as specific customer specifications. These certifications are in many cases prerequisites, allowing us to comply to all market segment requirements.

**ISO 9001**

The information in this brochure is intended to be for general reference purposes only and is not intended to be a specific recommendation for any individual application. The application limits for pressure, temperature, speed and media given are maximum values determined in laboratory conditions. In application, due to the interaction of operating parameters, maximum values may not be achieved. It is vital therefore, that customers satisfy themselves as to the suitability of product and material for each of their individual applications. Any reliance on information is therefore at the user's own risk. In no event will Trelleborg Sealing Solutions be liable for any loss, damage, claim or expense directly or indirectly arising or resulting from the use of any information provided in this brochure. While every effort is made to ensure the accuracy of information contained herewith, Trelleborg Sealing Solutions cannot warrant the accuracy or completeness of information.

**To obtain the best recommendation for a specific application, please contact your local Trelleborg Sealing Solutions marketing company.** This edition supersedes all previous brochures. This brochure or any part of it may not be reproduced without permission.

## ■ Choosing the Right Seal for your Application

Turcon® Variseal® offers major benefits in the design of components such as cylinders. These include:

- Excellent leakage control
- High resistance to wear
- High resistance to extrusion into gaps
- Withstanding aggressive and abrasive process media
- Very good temperature capabilities
- Low friction
- Compact form

Turcon® Variseal® is available in a range of geometries and designs that allow the optimum profile to be selected for each application. They can be produced from a wide range of Turcon® materials, our proprietary PTFE based compounds. These are specially formulated for sealing elements and offer superior characteristics specifically matched to the demands of our customers.

When required, Variseal® can also be manufactured from Zurcon® Z80, our UHMWPE based material or Zurcon® Z48, our Thermoplastic Elastomer material.

To choose the best Turcon® Variseal® for your application, you must first decide the functional parameters. Table 1 and Table 2 on page 6 and Table 3 on page 7 can then be used to make an initial selection of seals and materials. These tables give details of where further details can be found in the catalog.

It is also important to consider the quality of the mating surface, which has a significant effect on the function and service life of the sealing system. Guidelines on these are given on page 20 and page 21.

If help is required in specification of a seal then contact Trelleborg Sealing Solutions. To find your local marketing company go to [www.tss.trelleborg.com](http://www.tss.trelleborg.com).

## ■ General

Turcon® Variseal® are single acting, spring-energized seals which are used for dynamic and static applications.

Variseal® are effective in a wide range of applications. They are chosen when higher resistance to chemical media is required, if the seal is required to operate in extremes of temperature and/or where good extrusion and compression characteristics are needed.

Turcon® Variseal® designs have three main characteristics:

- Application specific U-shaped seal profile
- Spring geometry suited to the particular application
- Proven high-performance Turcon® or Zurcon® polymers

Standard or custom geometries available in metric, inch and intermediate sizes ranging from 2 to 3,300 mm / 0.079 to 126 inches.

### METHOD OF OPERATION

All Variseal® designs included in this catalog have the same operating principle and differ only in their profile form and type of metallic spring used.

The Variseal® spring supplies the load required for sealing at low pressures (Figure 1). The "U" shaped jacket allows fluid pressure to energize the sealing lips, so total sealing pressure rises with increasing operating pressure (Figure 2).

Figure 1: Turcon® Variseal® without system pressure

Figure 2: Turcon® Variseal® with system pressure

### PERFORMANCE

The different types of Variseal® designs combined with the properties of Turcon® and Zurcon® materials offer design engineers a wide range of solutions to a large number of applications.

The most important characteristics of Variseal® designs are listed below:

- Very low coefficient of friction
- Good dynamic and static sealing
- Capable of sealing at high speeds up to 15 m/s / 2,940 fpm
- Almost universal chemical compatibility
- Operating temperature of -253 °C up to +300 °C (-423 °F to +572 °F)
- Very good thermal resistance
- Properties unaffected by contact with chemicals
- Good aging characteristics
- Low compression set
- Capable of withstanding high pressures above 200 MPa (2,000 bar / 29,000 psi) when using Back-up Rings
- Very good dry-running properties
- Can be installed in grooves according to AS4716 (Mil-G-5514 is an old spec) and DIN 3771

**Table 1: Turcon® Variseal® Selection Table**

Seal		Application			Technical Data				
Type	Page	Type of Application			Maximum Pressure		Working Temp. °C / (°F)	Maximum Speed

**Table 3: Turcon® and Zurcon® Material Selection Guide**

Material Code	Material Description	Temperature Range °C (°F)	Chemical Compatibility	Radiation Resistance
T01 / MF1*	Premium grade virgin PTFE for static, slow dynamic or light duty applications. MF1 for food contact service. Color: white	-253 to +260 (-423 to +500)	A	7 x 10 <sup>2</sup> Gray (7 x 10 <sup>4</sup> Rads)
T05	Premium grade modified PTFE. Light duty material with greater wear resistance than Turcon T01. Reciprocating and slow rotary applications. Color: turquoise	-200 to +260 (-328 to +500)	A	7 x 10 <sup>2</sup> Gray (7 x 10 <sup>4</sup> Rads)
T07	Proprietary polymer-reinforced compound for long wear life in difficult combinations of pressure and temperature. Color: black	-60 to +300 (-76 to +572)	A	7 x 10 <sup>2</sup> Gray (7 x 10 <sup>4</sup> Rads)
T12	Use where poor lubrication is a problem, good performance in valve applications. Color: black	-60 to +300 (-76 to +572)	A	7 x 10 <sup>2</sup> Gray (7 x 10 <sup>4</sup> Rads)
T24	High-grade formulation of virgin polytetrafluoroethylene (PTFE) based material compounded with carbon additive. Recommended for dynamic applications, in particular dry-running air and gas). Color: black	-60 to +300 (-76 to +572)	A	7 x 10 <sup>2</sup> Gray (7 x 10 <sup>4</sup> Rads)
T25	High-grade formulation of virgin polytetrafluoroethylene (PTFE) based material compounded with glass fibers and lubricant additives. Excellent wear and low friction characteristics for lubricated rotary applications. Color: black / grey	-60 to +300 (-76 to +572)	A	7 x 10 <sup>2</sup> Gray (7 x 10 <sup>4</sup> Rads)
T40 / MF4*	High-grade formulation of virgin polytetrafluoroethylene (PTFE) based material compounded with carbon fiber additive. Excellent wear and low friction characteristics. Suited to reciprocating and rotary applications. Suitable for use in media with poor lubricating properties and for dry-running situations. MF4, a specialized grade of Turcon® T40 compound for food contact service. Color: black / grey	-60 to +300 (-76 to +572)	A	7 x 10 <sup>2</sup> Gray (7 x 10 <sup>4</sup> Rads)
M79	High grade formulation of virgin polytetrafluoroethylene (PTFE) based material compounded with an aromatic polymer and lubricant. Especially suited for low pressure rotary applications and running against soft surfaces. Color: black / grey	-100 to +300 (-148 to +572)	A	7 x 10 <sup>2</sup> Gray (7 x 10 <sup>4</sup> Rads)
MF6*	High grade formulation of virgin polytetrafluoroethylene (PTFE) based material compounded with an aromatic polymer. Especially suited for low pressure rotary applications and running against soft surfaces. MF6 for food contact service. Color: beige	-60 to +260 (-76 to +500)	A	7 x 10 <sup>2</sup> Gray (7 x 10 <sup>4</sup> Rads)
Z48	TPE (thermoplastic elastomer) for tight sealing with long wear life in applications without high temperatures or corrosive chemicals. Color: black	-62 to +135 (-80 to +275)	C	1.5 x 10 <sup>5</sup> Gray (1.5 x 10 <sup>7</sup> Rads)
Z80	UHMW Polyethylene. Excellent wear and abrasion resistance. Very good lubricity in water based media. Color: translucent white	-253 to +80 (-423 to +176)	B	1 x 10 <sup>5</sup> Gray (1 x 10 <sup>7</sup> Rads)

For temperatures above 500 °F (260 °C), please reference the Society of Plastics Industry's Safe Handling Guide.

\* MF grade materials have compliance to FDA, EU or Chinese GB standards. Contact your local Trelleborg Sealing Solutions marketing company for detailed compliance information.

## ■ Turcon® Seal Materials

Turcon® materials are high performance thermoplastics specifically developed for sealing applications. They are based on premium-grade PTFE fluoropolymer resins, with the properties of each compound achieved by the addition of fillers and special processing techniques.

Turcon® materials offer the following benefits:

### Low Coefficient of Friction

Friction is dependent on pressure, contact surface area, speed and lubrication. Turcon® materials have very good friction characteristics. For example, a coefficient of friction on steel mating surfaces of 0.04 can be achieved under lubricated and hydrodynamic conditions.

Turcon® materials do not adhere to their mating surfaces and show only a slight difference between static and dynamic friction, thus eliminating the danger of the stick-slip effect in dynamic applications.

### Chemical Compatibility

Turcon® materials are stable in all hydraulic fluids. Seal materials should be chosen to suit the lubricating properties of hydraulic media and the wear properties of seal and mating surfaces.

There is only a slight change in chemical properties of Turcon® materials, compared to chemically inert virgin PTFE, dependent on the type of filler material added.

### Temperature Range

Turcon® materials can be used at temperatures between -253 °C and +300 °C (-423 °F and +572 °F). The limits for low temperatures are dependent on seal design and the thermal contraction of the material. Special designs are available for sealing cryogenic fluids at temperatures below -200 °C (-328 °F).

General service temperature is limited to +300 °C (+572 °F). At temperatures above this, the seal materials begin to lose their strength and are subject to plastic deformation.

For temperatures above +260 °C (+500 °F), please reference the Society of the Plastics Industry's Safe Handling Guide.

### Temperature Cycling

Cyclical temperature fluctuations do not change the properties of Turcon® materials.

### High Surface Speeds

The mechanical properties of Turcon® materials mean they are excellent in dynamic applications, even under extreme loads.

Turcon® seals offer higher operational reliability than elastomer seals in dynamic situations, especially in dry starting or operating conditions, as they do not suffer from adhesion or heat generation. When the application is lubricated, seal life will be extended further.

### Wear Resistance

Wear resistance is dependent upon material fillers which influence the Turcon® material's mechanical and physical properties. Fillers in Turcon® include graphite, carbon, carbon fiber, glass fiber, molybdenum disulphide and other polymers. They can give increased resilience, improved wear resistance, reduced thermal expansion and extremely high resistance to abrasive wear.

### Aging

Turcon® materials remain unchanged over extended periods. They are practically non-aging and do not become brittle or degrade, even when subject to severe weathering from heat, light, water or salt spray.

### Radiation

Turcon® materials exhibit a low resistance to electron and gamma radiation and are not recommended for use in applications where the accumulated radiation doses exceed  $7 \times 10^2$  Gy ( $7 \times 10^4$  rad). For applications, subject to high radiation doses, special fluoropolymers such as ETFE and PCTFE or Turcon® materials should be selected.

### Other Properties

Some Turcon® materials have outstanding electrical properties, such as a low dielectric constant or a very high electric strength, even at elevated temperatures.

Physiologically safe Turcon® materials are available which meet the requirements of the German Federal Health Authority (BGA) and the FDA Regulation (Food and Drug Administration) No. 21 CFR, Part 177.

The water absorption of Turcon® materials is < 0.01%.

## ■ Zurcon® Seal Materials

### **Zurcon® Z80**

Zurcon® Z80 is a virgin Ultra High Molecular Weight Polyethylene, or UHMWPE. Because the water absorption of Zurcon® Z80 is zero, it is ideal for water service. Its abrasion resistance is five to ten times higher than PTFE, making it the material of choice in abrasive environments. As it is physiologically safe, it is also suitable for use in food and pharmaceutical processing.

The main characteristics of Zurcon® Z80 are:

#### **Low Friction**

The dry friction coefficient of Zurcon® Z80 is lower than most other materials though higher than many filled PTFE materials. Zurcon® Z80 forms a self-lubricating, non-stick surface.

#### **Chemical Compatibility**

Zurcon® Z80 is stable in all hydraulic fluids. It has a high resistance to acids, bases and aggressive media. The material has limited resistance to aromatic and halogenated hydrocarbons.

#### **Water Service**

Zurcon® Z80 is water repellent and does not swell in water. Its self-lubricating properties in water-based media are excellent, giving it significant advantage over many other materials including PTFE-based ones. This combined with its high strength and wear resistance means it has a long service life in aqueous solutions.

#### **Temperature Range**

Zurcon® Z80 has a maximum continuous operating temperature of +80 °C (+176 °F). Above this temperature its wear resistance and strength begins to decrease. In low-pressure applications it can be used at temperatures of +120 °C (+248 °F) for short periods and can be sterilized briefly at even higher temperatures. Its lowest operating temperature is -200 °C (-328 °F).

#### **Wear Resistance**

The abrasive wear resistance of Zurcon® Z80 is 5 to 10 times higher than that of PTFE based materials. It is therefore recommended in applications where seals are in contact with abrasive media such as paints, adhesives, salts, sludges, etc.

Zurcon® Z80 is also highly resistant to extrusion at high pressures.

#### **Radiation Resistance**

The radiation resistance of Zurcon® Z80 is significantly higher than that of PTFE based materials, maintaining good mechanical properties at radiation dosages of up to 100 kGy.

### **Zurcon® Z48 (TPE)**

Thermoplastic elastomer (TPE) materials combine several of the most desirable features of high performance elastomers and flexible plastics. They have exceptional toughness and resilience, with high resistance to creep, impact and fatigue. The premium grades used in the Variseal® are fully machinable as well as injection moldable and have the following notable properties.

#### **Sealing ability**

TPE conforms well to mating surfaces and, when energized by a spring load, has very good resilience making it an excellent sealing material with very low leakage rates.

#### **Friction**

The coefficient of friction of a typical TPE material ranges from 0.30 to 0.60, depending on the mating surface finish and other service conditions. It is not normally recommended for dry service except at very slow speeds due to concerns about heat generation leading to material degradation.

In lubricated service conditions the speed rating is greatly increased and TPE materials may then be considered for use in moderate to high speed reciprocating applications, or in slow to moderate speed rotary service.

#### **Wear and extrusion resistance**

TPE blends have excellent wear resistance in well lubricated service where heat generation is kept to a minimum. It is especially long lasting in low to moderate speeds in reciprocating service at low or high pressures. TPE is also noted for its excellent extrusion resistance in high pressure applications up to 68.9 MPa (10,000 psi).

#### **Temperature range**

TPE materials exhibit excellent physical properties over a broad temperature range. Various grades are flexible to -62 °C (-80 °F), and retain good physical properties at temperatures to +135 °C (+275 °F). At temperatures above +135 °C (+275 °F), however, TPE is only recommended in short term service because it is subject to heat aging and embrittlement.

#### **Compatibility**

Thermoplastic elastomers resist deterioration from many industrial chemicals, oils and solvents. They are resistant to swelling in oils and aliphatic and aromatic hydrocarbons at moderate temperatures. TPE is limited in its compatibility with hot water applications. For example, in long-term service sealing water at +71 °C (+160 °F), TPE loses much of its resilience and experiences a significant drop in tensile strength.

## Spring Types and Materials

A metal spring is incorporated into Turcon® Variseal® to provide elasticity to the seal. This makes the seal permanently elastic, despite changes in operating temperature, pressure or chemicals processed. Each of the three spring types used in Variseal® has unique properties that give them their performance characteristics. The two most important properties of the spring, besides the corrosion resistance of the metal, are load value and deflection range. The spring load affects sealing ability, friction and the wear rate of the seal. The deflection range determines the ability of the Variseal® designs to take up wear and compensate for variations in gland dimensions.

### V-Spring

V-Spring is the standard spring type for Variseal® **M2**, Variseal® **M2S** and **Roto Variseal®**. It operates as a set of "cantilever beams", extending from an arc at the bottom of the spring. The shape of the spring causes the load to be focused on the front edge of the sealing lip, giving the seal a positive wiping action. The V-Spring has a moderate load and deflection range.

### Helical Spring

The Helical spring, used in Variseal® **H** and Variseal® **HF**, is made from a flat strip formed into a helical coil spring. It has a much higher unit load and a shorter deflection range than the other spring types. Therefore, it is best suited to static or slow dynamic applications, where friction and wear are not the key issues. Variseal® **H** and Variseal® **HF** are the best choices for vacuum, gas and low temperature applications.

### Slantcoil® Spring

The Slantcoil® spring used in Variseal® **W2** consists of round wire formed into slanted coils and has a relatively constant load over a wide deflection range. This allows accurate control of friction during the working life of the seal. Its unique design makes it almost impossible to damage the spring by excessive deformation of the seal.

Figure 3: Comparison of load curves for the three spring types

### Spring Materials

The standard spring material for Turcon® Variseal® is stainless steel (spring code S). Two further materials are available for the specific applications, as detailed in the table below.

**Table 4: Spring Materials Selection Guide**

Media	Spring materials	Spring order code
<b>For General use e.g.</b> Oil Grease Air Water, steam Solvents Food, drugs Gas	<b>Stainless steel</b> DIN Mat No. 1.4310/1.4319 AISI 301/302 UNS 30100	S (Standard spring material)
<b>For use in corrosive media e.g.</b> Acids Caustics Seawater	<b>Hastelloy® C-276</b> DIN Mat No. 2.4819 UNS N10276	H
<b>For petrochemical use e.g.</b> Crude oil Sour gas	<b>Elgiloy® 1)</b> DIN Mat No. 2.4711 UNSR30003	E

## ■ Quality Criteria

Seals and bearings manufactured by Trelleborg Sealing Solutions are continuously monitored according to strict quality standards from material supply to delivery of finished parts.

Production plants are certified to international standards such as EN ISO 9001, covering quality control and management of purchasing, production and marketing functions.

All testing of materials and products is performed in accordance with accepted test standards and specifications. Our sealing materials are produced free of chlorofluorinated hydrocarbons and carcinogenic elements.

The tenth digit of our Trelleborg Sealing Solutions part number defines the quality characteristics of the part. A hyphen indicates compliance with standard quality criteria outlined in this catalog. Customer-specific requirements are indicated by a different symbol. Customers who require special quality criteria should contact their local Trelleborg Sealing Solutions marketing company for assistance.

## ■ Hardware Design Considerations

The best way to obtain optimum Variseal® performance is to plan ahead - during the design phase of your product. The initial phase should bring into alignment the three factors having the greatest impact on seal performance - the hardware design, the service conditions, and the seal design.

Design issues such as gland style, mating surface hardness and surface finish, and dynamic alignment should be reviewed and adjusted to work with the intended service conditions and to suit the selected seal design. The information in this section is primarily intended as a guide for the design of new hardware, however, it is completely applicable to the task of reviewing or modifying existing hardware to improve seal performance.

A primary goal in selecting a basic gland style is to be able to install the seals without damaging them. The first half of this Section describes the various gland types and installation procedures.

Once the issue of seal installation has been addressed, the goal of hardware design is then to improve seal performance in terms of wear life, leakage rate, friction, and so on.

### Basic Gland Styles

There are three basic gland styles to be considered - split, stepped, and solid (see Figure 4). The gland required for a radial Variseal® is similar to an O-Ring gland with one major difference - an O-Ring gland has a typically solid (one piece) construction with a full gland wall on each side. Since the Variseal® is made from polymers, which do not stretch like elastomers, installation in such glands can be difficult - or in many cases impossible. To install the Variseal® easily requires either the split gland or the stepped gland. The solid groove is sometimes used, but only when no other option exists and then only with certain diameter restrictions described later in the Groove Design section.

When retrofitting an existing solid gland for which the hardware cannot be modified, the solution might involve a special seal design or installation tools. Our engineering and technical support personnel are always available to assist you with these situations. To discuss your application, please contact your local Variseal® representative.

The basic gland styles shown above are described in further detail on the following pages.

Figure 4: Basic Radial Gland Styles

## ■ Basic Gland Types

### Split Gland

The best way to obtain optimum Variseal® performance is to plan a Split gland. A split gland designates hardware that is separated or “split” into two pieces to allow assembly without deforming the seal. The split gland minimizes potential damage to the seal. Its advantages include:

- No stretching of the seal
- Repeated installation without damage
- No special installation tools

The disadvantage is that a second piece such as an end plate is required to retain the seal. This might also involve a third piece such as a bolt to secure the end plate.

### Stepped Glands

A stepped gland has a small “step” or ledge, which retains the seal. The step height is small, so that the seal can be pushed past it easily. See the Groove Design section for recommended step heights. In most cases, no special tooling or installation procedures are required.

The stepped gland has the advantage of being a simpler configuration (with fewer pieces than the split gland) while maintaining relative ease of assembly. The stepped gland is an excellent configuration for piston seal applications.

### Solid Glands

Because the Variseal® does not stretch like an elastomeric O-ring, it is difficult to install in a solid radial groove. This gland is not recommended for new designs, but is often encountered when retrofitting existing glands. It can be used in those cases where the ratio of seal diameter to seal cross-section is large enough.

### Face Seal Glands

Face seal glands for the Variseal® are typically the same as O-ring glands, with no problems installing the seal. One advantage of the Variseal® in face seal applications is that it does not require a full gland wall on the pressure side of the seal.

Figure 5: Split or “two piece” Glands

Figure 6: Stepped Glands

Figure 7: Solid or “one piece” Glands

Figure 8: Face Seal Glands

## ■ Preventing Seal Damage

Taking a few reasonable precautions to prevent scratching the seals will increase seal life and reliability. To prevent damage during installation, consider the following aspects of hardware design:

- The installation path should be kept free of nicks, burrs, scratches, or any sharp edge that could damage the seal.
  - Any tool used to install seals should be free of sharp edges. Screw drivers are especially notorious for damaging seals and should not be used to handle the Variseal®.
  - A lead-in chamfer on the end of the rod or bore helps during installation. The proper chamfer dimensions are given in Groove design pages found later in this section. This is especially important where seals are to be installed face first (spring cavity side first) into the gland.
  - When seals must be installed across ports, bevel and smooth the edges of the ports.
  - Designate splines or keyways to fall on a smaller diameter than the sealing surface or use a protective sleeve to cover them during installation as illustrated in Figure 9 below.
- The Variseal® is typically installed without the aid of heat or lubrication. In situations where heat is required to soften and expand the seal, submerge them for a few minutes in very hot oil or water.
  - Application of a lubricant to surfaces of the seal and hardware reduces the force required to push the seal into a difficult gland such as a solid O-Ring groove.
  - During handling, place the seals where they will not be crushed by tools or other items. It is advisable to leave the seals in their shipping containers until just before installation.
  - Avoid glands which require bending the seals during installation. When seals must be stretched or compressed into a difficult gland, be sure to use the recommended tooling to resize the seals.
  - Do not sideload the seals any more than is necessary. Avoid gland situations where a heavy rod or piston rests against one side of the seal.

If you feel that your application poses an especially difficult problem with installation, contact the your local Variseal® representative.

Figure 9: Methods of Hardware Design to Prevent Seal Damages

## ■ Groove Design – Metric

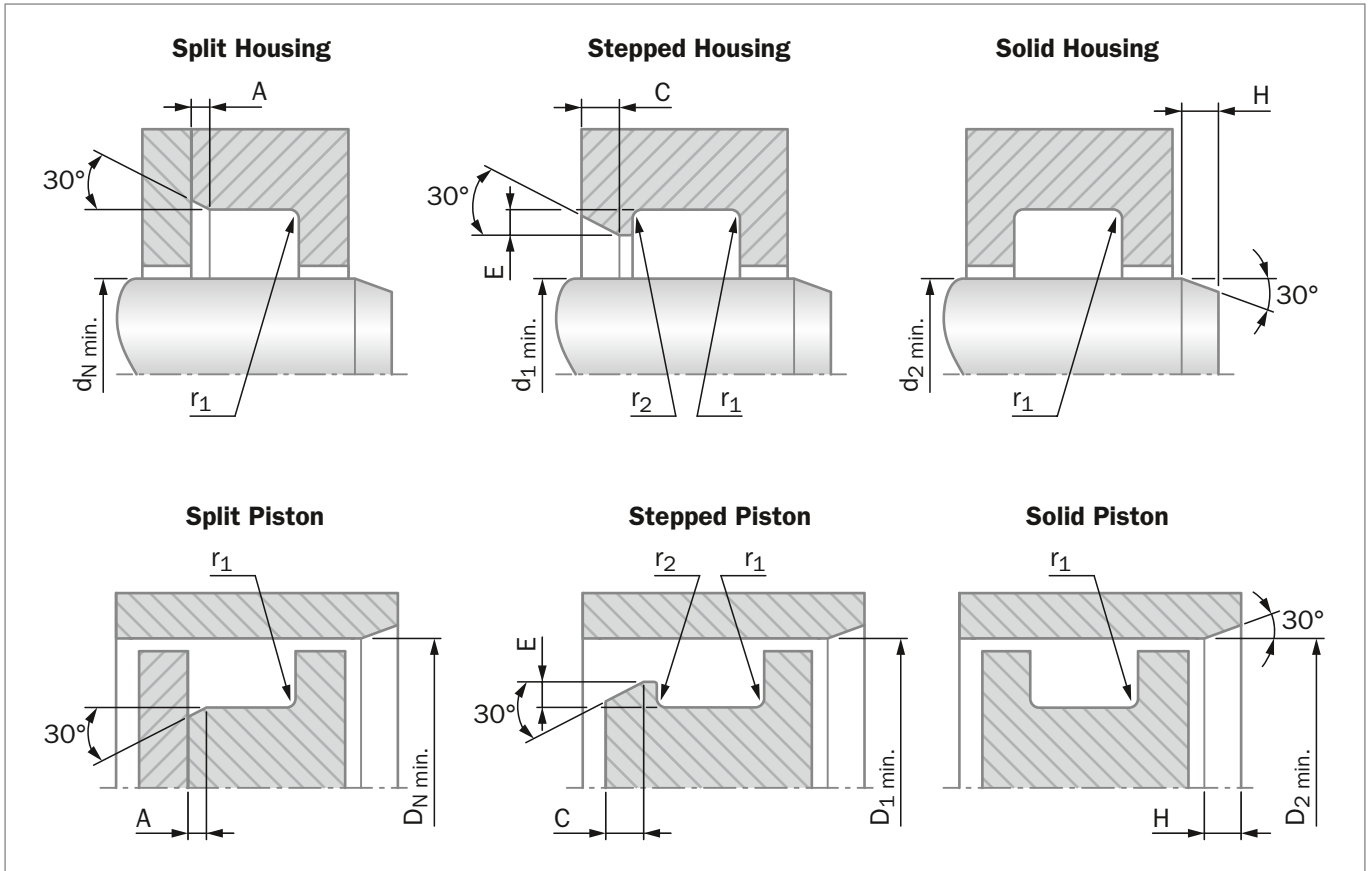

Figure 10: Variseal Groove Configurations

Installation lead-in chamfers and steps to include blend radii and are to be polished.

Table 5: Dimensions for Groove Designs – Metric

Series	Rod / Piston Groove Dimensions					
	A Chamfer	$r_1$ Maximum Radius	C Minimum Chamfer	$r_2$ Maximum Radius	E Minimum Step Height	H Minimum Chamfer
000	0.25 / 0.38	0.25	0.70	0.13	0.40	1.20
100	0.38 / 0.51	0.38	1.10	0.13	0.60	1.50

## ■ Surface Roughness

The functional reliability and service life of a sealing system is dependent upon the quality and surface finish of the mating surface to be sealed.

Scores, scratches, pores, concentric or spiral machining marks are not permitted. Higher demands must be made on the surface finish of dynamic mating surfaces than of static mating surfaces (Table 11).

The characteristics most frequently used to describe the surface micro finish Ra, Rz and Rmax are defined in DIN 4762/ISO 4287/1. These characteristics are not sufficient for assessing the suitability of a surface finish in seal engineering.

The material contact area Mr (previously percentage contact area tp) in accordance with ISO 4287/1, must also be taken into consideration. The significance of this surface specification is illustrated in Figure 12. It shows that specification of Ra and Rz does not describe the profile form accurately enough. The material contact area Mr is essential to assess surface suitability, as the specific profile form determines this parameter. This in turn is directly dependent on the machining process employed.

Figure 13 shows a printout from a commercially available surface measuring instrument. It contains all the information necessary to permit a precise description of a surface finish. Trelleborg Sealing Solutions recommends that the following surface finishes be observed:

**Table 11: Surface Roughness**

Recommended Maximum Surface Roughness µm and µin						
Media	Rotary Surface <sup>1)</sup>		Reciprocating Surface		Static Groove Surface	
Cryogenic and low molecular gases, hydrogen, helium, freon, oxygen, nitrogen	Rmax = 1.0 µm Rz = 0.63 µm Ra = 0.1 µm	Rmax = 39 µin Rz = 25 µin Ra = 4 µin	Rmax = 2.5 µm Rz = 1.6 µm Ra = 0.2 µm	Rmax = 98 µin Rz = 63 µin Ra = 8 µin	Rmax = 3.5 µm Rz = 2.2 µm Ra = 0.3 µm	Rmax = 138 µin Rz = 87 µin Ra = 12 µin
Low viscosity fluids water, alcohols, hydrazine, gaseous nitrogen, natural gas, skydrol, air	Rmax = 2.5 µm Rz = 1.6 µm Ra = 0.2 µm	Rmax = 98 µin Rz = 63 µin Ra = 8 µin	Rmax = 3.5 µm Rz = 2.2 µm Ra = 0.3 µm	Rmax = 138 µin Rz = 87 µin Ra = 12 µin	Rmax = 5.0 µm Rz = 3.5 µm Ra = 0.6 µm	Rmax = 197 µin Rz = 138 µin Ra = 24 µin
High viscosity fluids hydraulic oils, crude oil, gear oil, sealants, glue, milk products	Rmax = 2.5 µm Rz = 1.6 µm Ra = 0.2 µm	Rmax = 98 µin Rz = 63 µin Ra = 8 µin	Rmax = 4.0 µm Rz = 2.5 µm Ra = 0.4 µm	Rmax = 157 µin Rz = 98 µin Ra = 16 µin	Rmax = 6.5 µm Rz = 5.0 µm Ra = 0.8 µm	Rmax = 256 µin Rz = 197 µin Ra = 32 µin

1) The sealing surface must be free from spiral grooves.

The material contact area Mr should be approximately 50% to 70%, determined at a cut depth  $c = 0.25 \times Rz$ , relative to a reference line of  $C_{ref}$ . 5%.

Figure 12 shows two surface profiles, both of which give nearly the same values for Rz in the test procedure. The difference shows up when the material contact areas are compared. These show that the upper profile with Mr = 70% has the better seal to mating surface ratio.

Figure 12: Profile forms of surfaces

## TEST PROCEDURE

Depending on the current test program, the test procedure can contain the following elements:

- Company text (1)
- Workpiece text (2)
- Program number, measurement number, test conditions (3)
- Characteristics (4)
- Material contact area (5)
- Characteristic curves (6)
- Profile curve (7)

### Evaluation of the test procedure

- a) The values for  $R_a$ ,  $R_z$  and  $R_{max}$  correspond to our recommendations.
- b) The cut length is calculated with  $c = 0.25 \cdot R_z = 0.25 \cdot 0.7752 =$  approximately 0.200 with a material contact area  $M_r =$  approximately 70%
- c) The ratio  $R_z/R_a = 9.81$  indicates a closed profile.

Figure 13: Measurement printout

## Turcon® Variseal® M2

### DESCRIPTION

Turcon® Variseal® M2 is a single acting seal consisting of a U-shaped jacket and a V-shaped corrosion resistant spring. Variseal® M2 has an asymmetric seal profile. The optimized front angle offers good leakage control, reduced friction and long service life.

Figure 14: Turcon® Variseal® M2

### AREAS OF APPLICATION

- Hydraulic components, e.g. cylinders, valves, pumps, etc.
- Chemical processing equipment
- Pharmaceutical processing
- Food and beverage processing
- Spindle seals for machine tools
- Pneumatics, cylinders and valves

### ADVANTAGES

- Suitable for reciprocating and rotary applications
- Low coefficient of friction
- Stick-slip free operating
- High abrasion resistance
- Dimensionally stable
- Resistant to most fluids, chemicals and gases
- Withstands rapid changes in temperature
- No vulcanizing between seal and hardware
- Excellent resistance to aging
- Can be sterilized
- Available in Hi-Clean version
- Interchangeable with O-Ring and Back-up Ring combinations to AS4716 and ISO 6194

### TECHNICAL DATA

<b>Operating pressure:</b>	Maximum dynamic load: 20 MPa / 2,900 psi Maximum static load: 40 MPa / 5,800 psi (207 MPa / 30,000 psi with back-up ring)
<b>Speed:</b>	Reciprocating up to 15 m/s / 3,000 fpm Rotating up to 1.27 m/s / 240 fpm
<b>Operating temperature:</b>	-70 °C to +300 °C / -94 °F to +572 °F Special Turcon® and Zurcon® materials as well as alternative spring materials are available for applications outside this temperature range.
<b>Media compatibility:</b>	Virtually all fluids, chemicals and gases

### IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.

Temperature range also dependent on media.

## Turcon® Variseal® M2S

### DESCRIPTION

Turcon® Variseal® **M2S** is a single acting seal consisting of a U-shaped jacket and a V-shaped corrosion resistant spring. Variseal® M2S has an asymmetric seal profile. The dynamic lip is optimized, offering long service life and a good scraping ability even in media with high viscosity.

Figure 15: Turcon® Variseal® M2S

### AREAS OF APPLICATION

- Hydraulic components with highly viscous media
- Food processing, for example bottling plants for dairy and food products
- Pharmaceutical and chemical industries
- Processing of sealing compounds, adhesives, pastes, etc.
- Media with particle ingress

### ADVANTAGES

- Suitable for reciprocating and light duty rotary movement
- Excellent scraping ability
- High abrasion resistance
- Dimensionally stable
- Resistant to most fluids and chemicals
- Excellent resistance to aging
- Available in Hi-Clean version
- Interchangeable with O-Ring and Back-up Ring in most cases

### TECHNICAL DATA

<b>Operating pressure:</b>	Maximum dynamic load: 20 MPa / 2,900 psi Maximum static load: 40 MPa / 5,800 psi (207 MPa / 30,000 psi with custom designs)
<b>Speed:</b>	Reciprocating up to 15 m/s / 3,000 fpm Rotating up to 1.27 m/s / 250 fpm
<b>Operating temperature:</b>	-70 °C to +300 °C / -94 °F to +572 °F Special Turcon® and Zurcon® materials as well as alternative spring materials are available for applications outside this temperature range.
<b>Media compatibility:</b>	Fluids of medium to high viscosity or containing hard particles

### IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.  
Temperature range also dependent on media.

## Turcon® Variseal® W2

### DESCRIPTION

Turcon® Variseal® W2 is a single acting seal consisting of a U-shaped jacket and a corrosion resistant Slantcoil® spring. The Slantcoil® spring in the Variseal® W2 provides an almost constant load irrespective of hardware tolerances, eccentricity and seal wear.

Figure 16: Turcon® Variseal® W2

### AREAS OF APPLICATION

- Hydraulic or pneumatic measuring instruments
- Servo valves, pressure switches
- Electronic equipment
- Laboratory apparatus

### ADVANTAGES

- Suitable for reciprocating and light duty rotary movement
- Constant initial squeeze of spring over a large control area
- Interchangeable with O-Ring and Back-up Ring in most cases

### TECHNICAL DATA

<b>Operating pressure:</b>	Maximum dynamic load: 20 MPa / 2,900 psi Maximum static load: 40 MPa / 5,800 psi (207 MPa / 30,000 psi with custom designs)
<b>Speed:</b>	Reciprocating up to 15 m/s / 3,000 fpm Rotating up to 1.27 m/s / 250 fpm
<b>Operating temperature:</b>	-70 °C to +300 °C -94 °F to +572 °F
<b>Media compatibility:</b>	Virtually all fluids, chemicals and gases

### IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.  
Temperature range also dependent on media.

## Turcon® Variseal® H

### DESCRIPTION

Turcon® Variseal® H is a single acting seal consisting of a U-shaped jacket and a helical wound corrosion resistant spring. The helical spring of Variseal® H has a high spring loading, which gives excellent sealing integrity at low pressure. Variseal® H is suitable for dynamic applications and ideal in static applications.

Figure 17: Turcon® Variseal® H

### AREAS OF APPLICATION

- Compressors
- Ball valves
- Construction - equipment and plant
- Chemical processing
- Crude oil and natural gas installations
- Cryogenic engineering
- Nuclear power engineering
- Vacuum applications
- Pivot joints
- Gas chromatographs

### ADVANTAGES

- High contact pressure
- Excellent sealing integrity in gas and fluid applications
- Withstands rapid changes in temperature
- Good sealing ability when surfaces are not ideal
- Excellent resistance to aging
- Interchangeable with O-Ring and Back-up Ring in most cases

### TECHNICAL DATA

<b>Operating pressure:</b>	Maximum dynamic load: 20 MPa / 2,900 psi Maximum static load 40 MPa / 5,800 psi (207 MPa / 30,000 psi with custom designs)
<b>Operating temperature:</b>	-100 °C to +200 °C / -148 °F to +392 °F
<b>Media compatibility:</b>	Virtually all fluids, chemicals and gases

### IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.

Temperature range also dependent on media.

## Turcon® Variseal® HF

### DESCRIPTION

Turcon® Variseal® **HF** is the standard seal for axial (face) applications. It has a high spring loading, which gives excellent sealing integrity at low pressure and is available for both internal and external pressure.

The heavy helical spring in Variseal® HF makes it the best choice for vacuum, gas and low temperature flange sealing applications.

Figure 24: Turcon® Variseal® HF

### AREAS OF APPLICATION

- Compressor housings
- Construction equipment and plant
- Chemical processing
- Crude oil and natural gas installations
- Cryogenic engineering
- Nuclear power
- Vacuum applications
- Pivot joints

### TECHNICAL DATA

<b>Operating pressure:</b>	Maximum static load: 60 MPa / 8,702 psi Maximum dynamic load: 20 MPa / 2,900 psi (207 MPa / 30,000 psi with Back-up Ring)
<b>Speed:</b>	Static to slow rotating or pivoting movements
<b>Operating temperature:</b>	-150 °C to +200 °C / -238 °F to +392 °F
<b>Media compatibility:</b>	Virtually all fluids, chemicals compatibility: and gases

### IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time. e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.  
Temperature range also dependent on media.

## Turcon® Roto Variseal®

### DESCRIPTION

Turcon® Roto Variseal® is excellent in rotary, reciprocating and static applications, when there is a need to lock the seal in the groove.

The standard Variseal® for rotary applications, Turcon® Roto Variseal® is a single acting seal consisting of a U-shaped jacket and a V-shaped corrosion resistant spring.

Turcon® Roto Variseal® has a flanged heel, which prevents the seal from rotating in the groove and a short heavy dynamic lip that reduces friction. This gives a long service life and good scraping ability, even in media of high viscosity.

Figure 29: Turcon® Roto Variseal®

### AREAS OF APPLICATION

- Rotary shafts on general hydraulic applications
- Plastic injection molding machines
- Rotating and pivoting arms
- Gearbox shafts

### TECHNICAL DATA

<b>Operating Pressure:</b>	Maximum dynamic load: 20 MPa / 2,900 psi Maximum static load: 25 MPa / 3,626 psi
<b>Speed:</b>	Reciprocating up to 10 m/s / 1,980 fpm, Rotating up to 2 m/s / 390 fpm
<b>Temperature:</b>	-70 °C to +300 °C / -94 °F to +572 °F
<b>Media compatibility:</b>	Virtually all fluids, chemicals and gases

### IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e. g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also depends on the media.

### FRICTIONAL FORCE

Indicative values for frictional force are included in figure below. Frictional force is given as a function of sliding speed and operating pressure for a shaft diameter of 2 inch / 50 mm at an oil temperature of +140 °F / +60 °C. The operating limits are lower at higher temperatures.

Indicative values for other shaft diameters can be calculated from the formula:

$$P \cong P_{50} \times \left( \frac{d}{50 \text{ mm}} \right) \text{ [W]}$$

Figure 30: Frictional Force for Turcon® Roto Variseal®

The indicative values apply for constant operating conditions. Changes in these, such as pressure fluctuations or direction of rotation, can result in significantly higher frictional values.

### APPLICATION LIMITS

The maximum operating limits for temperature, pressure and speed are dependent upon one another and therefore cannot all apply at the same time.

The lubrication properties of the media to be sealed and heat dissipation must also be taken into consideration.

The following PV values can be used as general guidelines:

- Poor lubrication up to PV = 2 MPa x m/s (950 psi x ft/s)
- Good lubrication up to PV = 5 MPa x m/s (2375 psi x ft/s)
- Very good cooling up to PV = 8 MPa x m/s (3800 psi x ft/s)

These values are lower for diameters < 50 mm / 2 inches. Tests of these characteristics are recommended to establish application limits.

### MATING SURFACE MATERIALS

Sealing of applications with rotating movements require very good mating surfaces. A minimum hardness 55 HRC is recommended to a hardening depth of at least 0.3 mm / 0.01 inch.

Particular attention must be paid to coated surfaces and good heat dissipation through the coating is required.

**Table 42: Permissible Eccentricity for Turcon® Roto Variseal®**

**Table 49: Non-Catalog Standard Seal Design**

Seal	Application			Technical Data								Comments			
	Type of Application			Maximum Pressure				Working Temperature		Maximum Speed					
	Type	Static	Reciprocating	Rotary	Dynamic		Static		°C	°F	Recip.		Rotary		
					MPa		MPa				m/s		fpm	m/s	fpm
					Bar	psi	Bar	psi							
W2S 	C	A	C	20		40		-70 to +300	-94 to +572	15	1954	1.27	250	A wiper for those applications that require close control of friction or torque, or with wider hardware tolerance or eccentricities.	
				200	2900	400	5800								
M2 with Ext Heel 	C	A	B	40		52		-70 to +300	-94 to +572	15	1954	1.27	250		For greater extrusion resistance in applications with high pressures and/or temperatures.
				400	5800	520	7500								
W2 with Ext Heel 	C	A	B	40		52		-70 to +300	-94 to +572	15	1954	1.27	250		
				400	5800	520	7500								
MF 	A	-	C	n/a		60		-100 to +200	-148 to +392	n/a	n/a	n/a	For static, slow rotary, or oscillating service sealing between two faces.		
						600	8702								
WF 	A	-	C	n/a		60		-150 to +200	-238 to +392	n/a	n/a	n/a		Same as above except with Slantcoil® use for greater flexibility in small diameters and crosssections.	
						600	8702								
FM 	B	B	A	20		25		-70 to +300	-94 to +572	15	1954	2.00			360
				200	2900	250	3626								
FW 	B	B	A	20		25		-70 to +300	-94 to +572	15	1954	2.00	360		The Slantcoil® spring provides closer control of torque values for low friction applications, and to reduce heat generation in general.
				200	2900	250	3626								
PM 	B	B	A	20		25		-54 to +204	-65 to +400	15	1954	2.00	360	The O-Ring in the seal's O.D. groove acts to prevent rotation with the shaft and to provide a positive static seal on the O.D.	
				200	2900	250	3626								
PW 	B	B	A	20		25		-54 to +204	-65 to +400	15	1954	2.00	360		
				200	2900	250	3626								
CM 	B	B	A	20		25		-70 to +300	-94 to +572	15	1954	2.00	360		A metal encased version of the Variseal PW. The metal provides the most reliable anti-rotation feature of all the rotary seals listed above.
				200	2900	250	3626								
CW 	B	B	A	20		25		-70 to +300	-94 to +572	15	1954	2.00	360	Similar to Variseal CM, this design is energized with a Slantcoil spring which provides lower friction and closer control of torque values.	
				200	2900	250	3626								

## ■ Special Types

### TURCON® VARISEAL® HI-CLEAN

Turcon® Variseal® M2, M2S and Roto Variseal® are available with the spring groove filled with high temperature silicone. Extremely important in food and pharmaceutical processing, this minimizes the trapping of contaminants within the seal, making it easier to clean.

#### ADVANTAGES

- Significantly reduced dead space
- Can be sterilized easily
- Silicone compound increases sealing pressure

When ordering Variseal® Hi-Clean, change the last digit to the letter R.

### TURCON® VARISEAL® WITH EXTENDED HEEL

All Turcon® Variseal® types except the Turcon® Roto Variseal® can be supplied with an extended heel as an alternative to existing O-Ring groove versions, with or without back-up ring (Figure 33 and Figure 35).

Figure 33: Standard O-Ring groove with and without Back-up Ring

Figure 34: Turcon® Variseal® Hi-Clean

#### ORDERING EXAMPLE

Turcon® Variseal® M2S

<b>Series:</b>	Series RVC2
<b>Type:</b>	N = No Notch, Rod dia <1000
<b>Rod Diameter x 10:</b>	$d_N = 35.0$ mm
<b>Quality Index:</b>	Industrial

This version is also recommended for high-pressure applications or when the extrusion gap is larger than prescribed.

Figure 35: Standard Turcon® Variseal® and Turcon® Variseal® with extended heel

Table 50: Groove Widths

Series No.				Groove Width mm (inch)	
Rod		Piston		L <sub>1</sub>	L <sub>3</sub>
RV_0	RV_A	PV_0	PV_A	2.40 (0.094)	3.80 (0.149)
RV_1	RV_B	PV_1	PV_B	3.60 (0.141)	4.65 (0.183)
RV_2	RV_C	PV_2	PV_C	4.80 (0.188)	5.95 (0.235)
RV_3	RV_D	PV_3	PV_D	7.10 (0.281)	8.50 (0.334)
RV_4	RV_E	PV_4	PV_E	9.50 (0.375)	12.05 (0.475)
RV_5	RV_G	PV_5	PV_G	15.00 (0.591)	20.00 (0.787)

Groove widths for standard grooves L<sub>1</sub> and grooves with one Back-up Ring to L<sub>3</sub>.

A wide range of special and customized Variseal® designs are available. These may be slight modification to standard designs or a completely new configuration if required.

Table 51: Determining the TSS Article Number

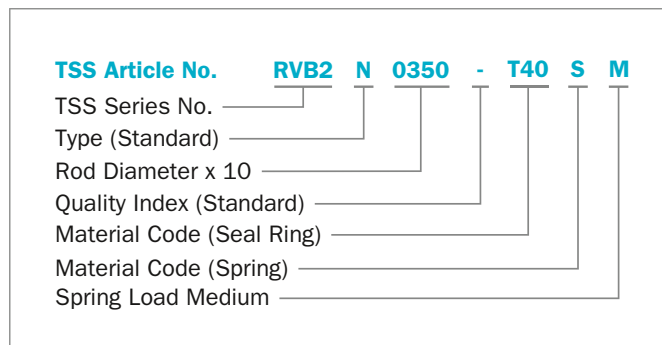

Turcon Variseal® Types	Standard Rod/Piston	Extended Heel Rod/Piston
Turcon Variseal® M2	RVA/PVA	RVB/PVB
Turcon Variseal® M2S	RVC/PVC	RVD/PVD
Turcon Variseal® W2	RVJ/PVJ	RVL/PVL
Turcon Variseal® H	RVE/PVE	RVF/PVF

When ordering the above seal types, use the first two letters of the standard TSS Article Number and replace the third letter as shown in table.

ORDERING EXAMPLE

Turcon® Variseal® M2 Extended Heel

<b>Series:</b>	Series RVB2
<b>Type:</b>	N = No Notch, Rod dia <1000
<b>Rod Diameter x 10:</b>	d <sub>N</sub> = 35.0 mm
<b>Quality Index:</b>	Industrial
<b>Material Code (Seal):</b>	T40
<b>Material Code (Spring):</b>	Stainless Steel
<b>(Spring):</b>	Spring Load; Medium

### Rod/Face Seal

Low pressure seal to overcome large eccentricity

### High Pressure System

Sealing system for extreme high pressure

### Double Acting Piston Seal

Hi-Clean version

### Turcon® Variseal® with Corner Reinforcement

Variseal® with high modulus corner reinforcement for high temperatures in combination with high pressure or large extrusion gap

### Conical Seal

Variseal® produced in conical arrangement to seal against angled faces

### Double Decker

Can be adopted to most groove dimension

Figure 36: Customized Designs

## ■ General Quality Criteria

The cost-effective use of seals and bearings is highly influenced by the quality criteria applied in production. Seals and bearings from Trelleborg Sealing Solutions are continuously monitored according to strict quality standards from material acquisition through to delivery.

Production facilities are certified according to relevant quality management system standards. Depending on the requirements of the customer or market and in addition to the current ISO 9001, these locations may have further certifications: IATF 16949 for Automotive customers, EN/AS 9100 for Aerospace customers, ISO 13485 for Healthcare & Medical customers and ISO 29001 for Oil & Gas customers. This enables us to provide all market segments with the required quality standards.

Our quality policy is consistently controlled by strict procedures and guidelines which are implemented within all areas of the company.

All testing of materials and products is performed in accordance with accepted test standards and specifications, e.g. random sample testing in accordance with ISO 2859-1 AQL 1.0 general inspection level II, normal inspection.

Inspection specifications correspond to standards applicable to individual product groups (e.g. for O-Rings: ISO 3601).

## ■ Guidelines for the Storage of Polymer Products Based on ISO 2230

Many polymer products and components are stored for long periods of time before being put into service, so it is important they are stored in conditions that minimize unwanted changes in properties. Such changes may result from degradation, in which case they may include excessive hardening, softening, cracking, crazing and other surface effects. Other changes may be caused by deformation, contamination or mechanical damage.

### **Packaging**

Unless otherwise specified in the appropriate product specification, rubber products should be enclosed in individual sealed envelopes. The packaging should be carried out in an atmosphere in which the relative humidity is less than 70%, or if polyurethanes are being packed, less than 65%. Where there is serious risk of ingress of moisture (e.g. rubber-metal-bonded parts), aluminum foil/paper/polyethylene laminate or other similar means of protection should be used to ensure protection from ingress of moisture.

### **Temperature**

The preferred storage temperature for elastomer parts is +15 °C (+59 °F) and should not exceed +25 °C (+77 °F). The products should be stored away from direct sources of heat such as boilers, radiators and direct sunlight. If the storage temperature is below +15 °C (+59 °F), care should be exercised during handling of stored products, as they may have stiffened and have become susceptible to distortion if not handled carefully.

### **Humidity**

The relative humidity should be such that, given in the variations of temperature in storage, condensation does not occur. In all cases, the relative humidity of the atmosphere in storage should be less than 70%, or if polyurethanes are being stored, less than 65%.

### **Light**

Rubber should be protected from light sources, in particular direct sunlight or intense light having a high ultra-violet content. It is advisable that any windows of storage rooms be covered with a red or orange coating or screen.

### **Radiation**

Precautions should be taken to protect stored products from all sources of ionizing radiation likely to cause damage to the products.

### **Ozone**

Ozone has a particularly harmful effect on rubber. Storage rooms should not contain any equipment that is capable of generating ozone, such as mercury vapor lamps or high-voltage electrical equipment giving rise to electric sparks or electrical discharges. Combustion gases and organic vapors should also be excluded, as they may give rise to ozone via photo-chemical processes. When equipment such as a fork-lift truck is used to handle large rubber products, care needs to be taken to ensure this equipment is not a source of pollution that may affect the rubber. Combustion gases should be considered separately. While they are responsible for generating ground-level ozone, they may also contain unburned fuel which, by condensing on rubber products, can cause additional deterioration.

**Deformation**

Rubber should be stored free from tension, compressive stresses or other causes of deformation. Where products are packaged in a strain-free condition, they should be stored in their original packaging. In case of doubt, the manufacturer's advice should be sought. It is advisable that rings of large internal diameter are formed into three equal loops so as to avoid creasing or twisting. It is not possible to achieve this condition by forming just two loops.

**Contact with liquids and semi-liquid materials**

Rubber should not be allowed to come into contact with liquid or semi-liquid materials (for example, petrol, greases, acids, disinfectants, cleaning fluids) or their vapors at any time during storage, unless these materials are by design an integral part of the product or the manufacturer's packaging. When rubber products are received coated with their operational media, they should be stored in this condition.

**Contact with metals**

Certain metals and their alloys (in particular, copper and manganese) are known to have harmful effects on some rubbers. Rubber should not be stored in contact with such metals except when bonded to them. They should be protected by wrapping in, or by separation with, a suitable material, e.g. paper or polyethylene.

**Contact with dusting powder**

Dusting powders should only be used for the packaging of rubber items in order to prevent adhesion. In such cases, the minimum quantity of powder to prevent adhesion should be used. Any powder used should be free from any constituent that would have a harmful effect on the rubber or the subsequent application of the rubber.

**Contact between different products**

Contact between products made from rubbers of different compositions should be avoided. This includes products of the same type but differing in color.

**Rubber-to-metal bonded products**

The metal part of rubber-to-metal bonded products should not come into contact with the rubber of other products. Preservative used on the metal should be of a type that it will not adversely affect the rubber or the bond to such an extent that it does not comply with the product specification.

**Storage life**

This is the maximum period of time that a rubber product, appropriately packaged, may be stored. After this time the product is regarded as unserviceable for the purposes for which it was originally manufactured. The storage life of a rubber product is influenced by its shape and size as well as its composition. Thick products usually undergo slower changes through degradation than thinner ones.

**Initial storage period**

This is the maximum period, starting from the time of manufacture, for which a rubber product, appropriately packaged, may be stored under specified conditions before a sample needs to be inspected or re-tested.

**Extension storage period**

This is the period for which a rubber product, appropriately packaged, may be stored after the initial storage period, before further inspection and re-testing is necessary.

**Assembly**

These are products or components containing more than one element, one or more of which is made of rubber. Generally it is not recommended to store elastomeric products in an assembled condition. If it is necessary to do so, the units should be checked more often. The inspection interval depends on the design and geometry of the components.

**Inspection before extension storage**

Before any items are to be stored for an extension period, representative samples of each type should be selected for inspection at the end of the appropriate initial storage period. Inspection should be in accordance with the relevant product specification.

**Visual inspection**

Inspect each of the items for the following:

1. Permanent distortions, such as creases or flats.
2. Mechanical damage, such as cuts, tears, abraded areas or delaminated plies.
3. Surface cracking when viewed under a microscope at x10 magnification.
4. Changes in surface condition, such as hardening, softening or tackiness.

**Assessment at the end of the initial period**

If, following the visual inspection procedure the items are not satisfactory, they should not be stored for an extended period. If the items are satisfactory and are stored for an extended period a record should be kept of the date initial storage began as well as the date the extended storage period began. Items stored for an extended period should be inspected and tested at, or before, the expiry of the extension storage period before they are put into service or stored for a further extended period.

**Table 52: Initial and extension storage periods for unassembled components**

Material Group	Initial Storage Period	Extended Storage Period
AU, EU, NR, SBR	5 years	2 years
ACM, AEM, CR, ECO, HNBR, IIR, NBR	7 years	3 years
CSM, EPDM, FKM, FMQ, FVMQ	10 years	5 years
FFKM Isolast®	20 years	5 years
Zurcon®	10 years	5 years
PTFE	unlimited	

Note 1: If the storage temperature is over or under +25 °C (+77 °F) this will influence the storage time. Storage at +10 °C (+50 °F) higher will reduce the storage time by about 50%. Storage at +10 °C (+50 °F) lower will increase the storage time by around 100%.

Note 2: In application areas such as aerospace the storage periods can differ from this specification. These specific storage conditions have to be agreed between the supplier and the buyer.

# Welcome to Trelleborg Sealing Solutions

## SEALING TECHNOLOGY

Trelleborg Sealing Solutions offers an outstandingly comprehensive sealing portfolio – a one-stop-shop providing the best in elastomer, silicone, thermoplastic, PTFE and composite technologies; solutions that feature in virtually every application conceivable within the aerospace, industrial and automotive industries.

## A WORLDWIDE PRESENCE

We are uniquely placed to offer a dedicated design and development service for sealing solutions; globally servicing, supporting and supplying customers through an unrivaled international network.

## COMMITMENT TO CUSTOMER, NEEDS LONG-TERM

Trelleborg Sealing Solutions is one of the world's foremost experts in polymer sealing technology. Using our expertise and experience, we facilitate customers in achieving cost-effective, durable solutions that match their specific business requirements.

### Trelleborg Sealing Solutions -

### Your Partner for Sealing Technology

# A world leader in engineered polymer solutions

## THE TRELLEBORG GROUP

**Trelleborg Coated Systems**  
 Leading global supplier of unique customer solutions for polymer-coated fabrics deployed in a variety of industrial applications.

**Trelleborg Industrial Solutions**  
 Market leader in such industrial application areas as hose systems, industrial antivibration solutions and selected industrial sealing systems.

**Trelleborg Offshore & Construction**  
 Leading global supplier of polymer-based critical solutions for deployment in highly demanding environments.

**Trelleborg Wheel Systems**  
 Trelleborg Wheel Systems is a leading global supplier of tires and complete wheels for agricultural and forestry machines, materials handling and construction vehicles, and two-wheeled vehicles.

**Trelleborg Sealing Solutions**  
 One of the world's leading developers, manufacturers and suppliers of precision seals. It supports its aerospace, industrial and automotive customers through over 20 production facilities and more than 50 marketing companies globally.

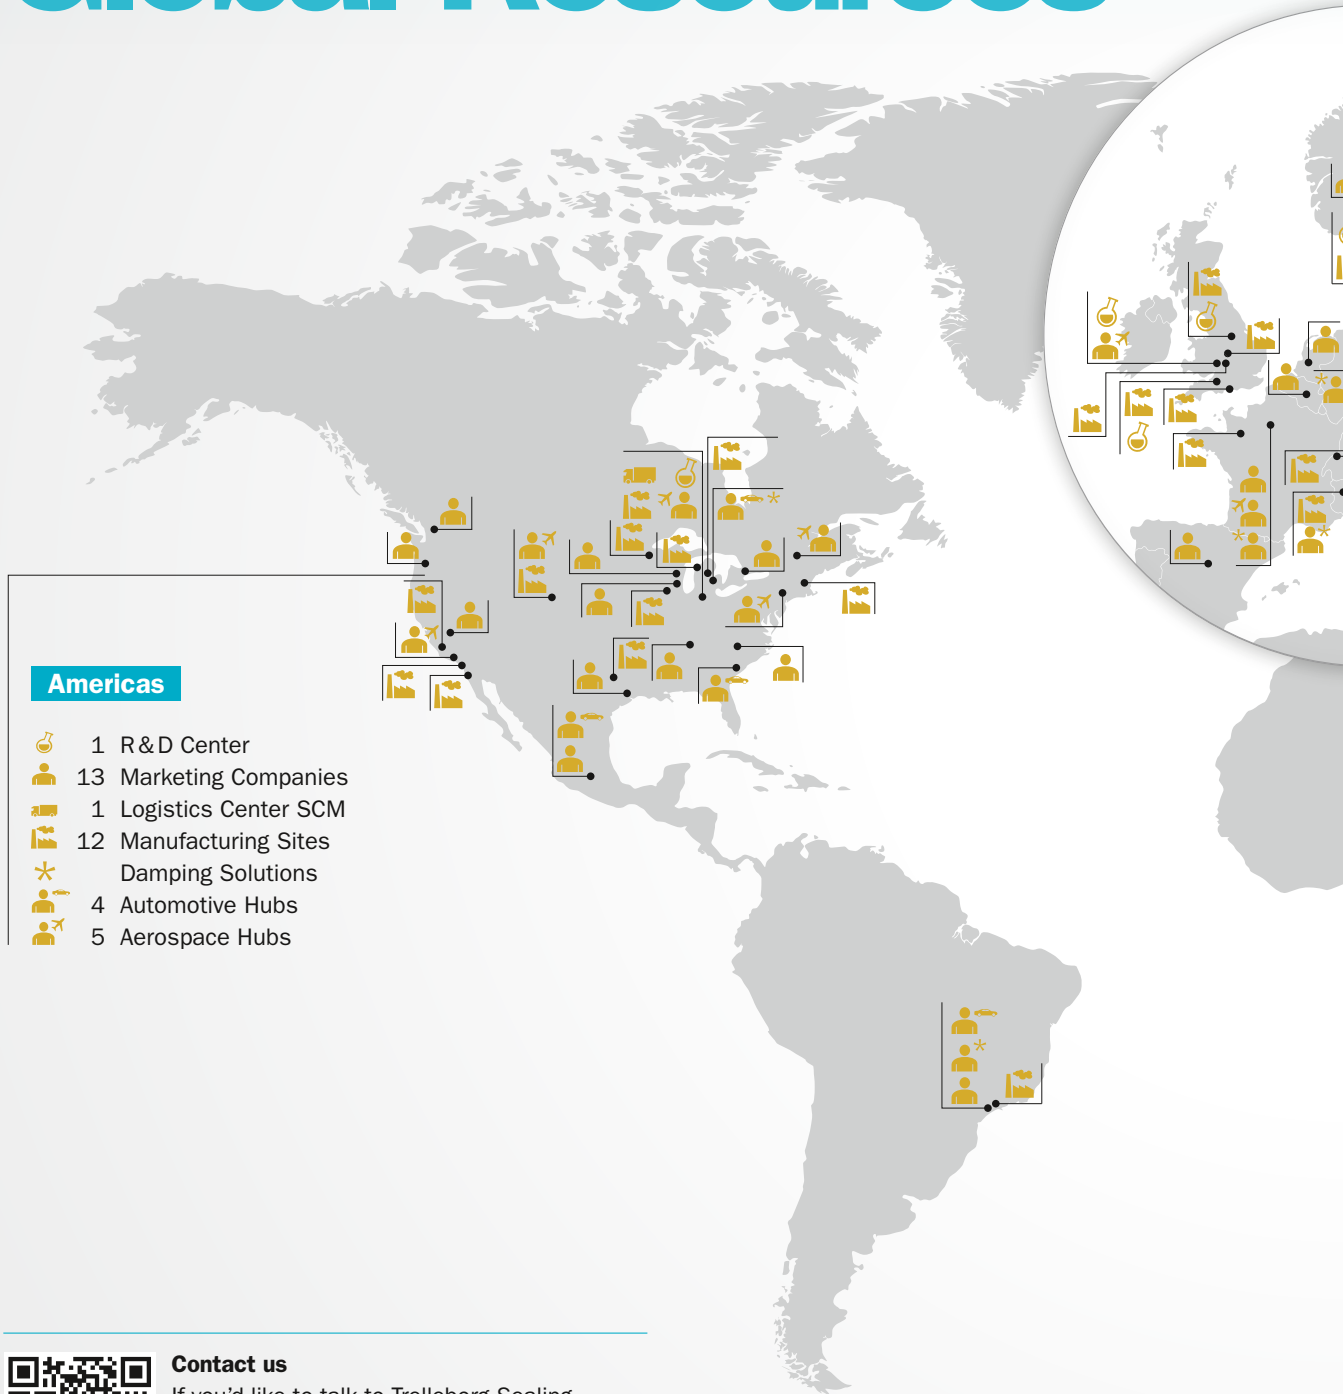

### BLUE DIMENSION™

At Trelleborg we believe that the benefits of our solutions stretch beyond functionality and business performance.

# Products, Brands & Materials

Decades of experience designing and manufacturing polymer solutions has led Trelleborg Sealing Solutions to develop, manufacture and supply a range of unique materials and proprietary product designs, many of which have become industry standards. Development is ongoing, ensuring that our solutions meet the changing needs of our customers, as well as the latest industry trends and regulations.

## PRODUCTS

Fluid Sealing Systems

Static Seals

Bearings & Bushings

Rotary Seals

Medical Components

Pneumatic Seals

O-Rings

Engineered Molded Parts

Mechanical Face Seals (Heavy Duty Seals)

HiMod® FlatSeal™ Gaskets

Brake Shims, Tuned Absorbers, Rubore® seals

Assembly Units

Liquid Silicone Rubber (LSR)

Customized Aerospace Sealing

Tubing & Hose Sealing

## WORLD RENOWNED NAMES UNITED

We own many of the longest established and leading names within the seal industry. These include:

- American Variseal
- Automated Dynamics
- Busak+Shamban
- Dowty Seals
- Chase Walton
- Forsheda
- GNL
- Impervia
- Nordex
- Orkot
- Palmer Chenard
- Polypac
- SSF
- SF Medical
- Shamban
- Silcofab
- Silcotech
- Sil-Pro
- Skega
- Stefa
- Wills

## PROPRIETARY MATERIALS

Ongoing development has yielded some of the most successful sealing and bearing materials available:

- HiMod®
- HiPlast®
- Isolast®
- Orkot®
- Turcite®
- Turcon®
- Turel®
- Zurcon®

# Films & Animations

## SEEING IS BELIEVING

Complex sealing configurations can feature a large number of sealing elements. Trying to illustrate these on a 2-D page is difficult and can never properly show their function or characteristics. Trelleborg Sealing Solutions uses the latest graphic technologies to produce 3-D animations of applications and typical sealing solutions for them.

TSS

### Films and Animations online

A range of films specific to different industries and products are available to view on the Trelleborg Sealing Solutions website or via YouTube.

# Simplify Your Business ServicePLUS

ServicePLUS aims at uniting various enhanced solutions across the entire value chain, simplifying the processes of engineering, logistics, manufacturing and aftermarket for the customer.

Engineering

Logistics

Manufacturing

Aftermarket

## SPECIAL HANDLING

Special Handling bundles an assortment of individual packaging solutions together with additional services that optimize the mounting and handling of seals.

## ADVANCED DELIVERY

Our Advanced Delivery services simplify your stock replenishment process by managing your different vendors and stock levels – be it through a Kanban system or complete C-Part Management.

## ENGINEERING SUPPORT SERVICES

Trelleborg provides world-class expert support for your engineering needs, from extensive design & compound competence to leading edge product testing.

## ASSEMBLY

Trelleborg is willing and able to offer pre-assembled parts put together by specially trained staff, delivered directly to you.

## QUICKSEAL

QuickSeal covers your short-notice needs for sealing solutions, whether you require a prototype, functional sample or a small batch rapidly.

## DIGITAL TOOLS

Online resources and apps developed to make an engineer's life easier.

Discover our wide range of digital tools at [www.tss.trelleborg.com](http://www.tss.trelleborg.com)

# Design Support & Engineering Tools

## ONLINE TOOLS MAKE LIFE EASIER

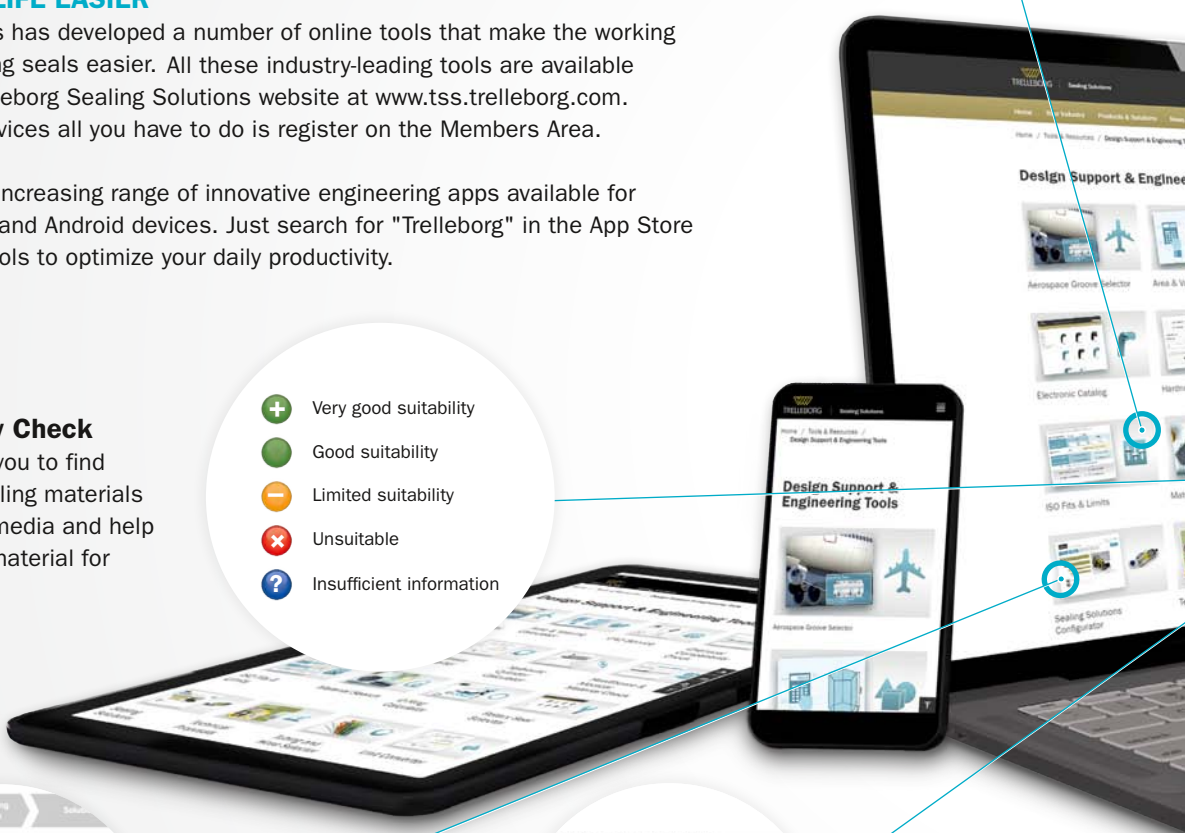

Trelleborg Sealing Solutions has developed a number of online tools that make the working life of an engineer specifying seals easier. All these industry-leading tools are available free-of-charge from the Trelleborg Sealing Solutions website at [www.tss.trelleborg.com](http://www.tss.trelleborg.com). To use these advanced services all you have to do is register on the Members Area.

There is also a continually increasing range of innovative engineering apps available for smartphones, both for iOS and Android devices. Just search for "Trelleborg" in the App Store or GooglePlay to find the tools to optimize your daily productivity.

## Materials Search and Chemical Compatibility Check

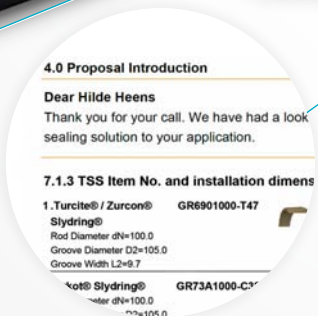

These two programs allow you to find out the compatibility of sealing materials with hundreds of different media and help identify the most suitable material for your application.

- + Very good suitability
- Good suitability
- Limited suitability
- ✗ Unsuitable
- ? Insufficient information

## Sealing Solutions Configurator

The Sealing Solutions Configurator is the first tool of its kind offered by any seal supplier. It allows engineers to identify a proven sealing solution for their specific application in just four easy steps.

## Technical Proposals Online

Enhance your communication with Trelleborg Sealing Solutions with the Technical Proposals Online tool. Instantly access all your proposed solutions anywhere at any time and benefit from quicker dialog with our sealing specialists.

**ISO Fits & Tolerances**

Our Fits & Tolerances Calculator allows you to easily determine type of fits using the tolerances according to DIN ISO 286. In addition, upon entering the nominal diameter the tool calculates lower and upper limit deviations plus the maximum and minimum interferences dependent on the selected tolerance classes for bore and shaft.

**Versatile CAD Service**

The CAD download functionality provides thousands of drawings of a wide range of seals. It gives the option of 2- or 3-dimensional files in a range of formats to suit most commonly used CAD systems.

**Hydraulic System Calculator**

Hydraulic System Calculator helps you design a solution around the cylinder which may involve motor, pump, orifice and pipe calculations. The application is in compliance with ISO 3320, ISO 3321 & ISO 4393.

**Rotary Seal Selector**

The Rotary Seal Selector allows you to search through the wide range of rotary seals and materials available based on application conditions and offers detailed information on installation and seal capabilities.

**O-Ring Calculator**

An industry-leading tool, the easy to use O-Ring calculator includes sizing capabilities, compression forces, design parameter recommendations and complete measurements. Results and comments may be printed, shared or filed as PDF.

Discover our design support and engineering tools at [www.tss.trelleborg.com](http://www.tss.trelleborg.com)

# Mobile Tools & Apps

We understand the needs of engineers on the go. Check out our latest mobile tools and apps, ranging from an O-Ring calculator to unit and hardness converters. Just search for "Trelleborg" in the App Store or Google Play to find the tools to optimize your daily productivity.

MANY MORE APPS available

Discover our wide range of mobile tools and apps at [www.tss.trelleborg.com](http://www.tss.trelleborg.com)

### ISO Fits & Tolerances

Simply enter the nominal diameter and select the tolerance classes for bore and shaft to find the complete ISO fits definition with all relevant values including type of fit, with handy graphs to illustrate the classes by bore and shaft.

### Mechanical Engineering Calculator

An excellent tool offers over 244 formulas in 16 categories, with more being added every update. Categories include the fields of mathematics, physics and mechanical engineering.

### Aerospace Groove Selector

This app covers two of the most important SAE aerospace groove standards for hydraulic systems, AS4716 Rev B and AS5857 Rev A, making it really easy to find the size of grooves and hardware needed.

### Installation Instructions

Videos demonstrate the best practice methods for installing seals, providing all relevant documentation within the interface, guiding you to a successful installation of Radial Oil Seals and Turcon® and Zurcon® rod and piston seals.

### Unit & Hardness Converter

By simply selecting the dimension and entering the value for conversion, the app offers a wide range of engineering and scientific units for each dimension.

**in the groove**

Our *in the groove* magazine provides news, technical and product information on seals, as well as insights into the markets they are used in. The magazine is also available in print and as an interactive PDF.

**Rotary Seal Selector**

Bring the popular Rotary Seal Selector webtool with you! Quickly search through Trelleborg Sealing Solutions rotary seals and materials for the optimum product for your application conditions while on the move.

**O-Ring Selector**

When a user enters installation specifications into the O-Ring Selector app, such as the bore or rod/shaft diameter, the app quickly calculates O-Ring and housing dimensions in both metric and inch.

**Hydraulic System Calculator**

Hydraulic System Calculator helps you design a solution around the cylinder which may involve motor, pump, orifice and pipe calculations. The application is in compliance with ISO 3320, ISO 3321 & ISO 4393.

**Area and Volume Calculator**

Speeds up and simplifies calculating the area and volumes of more than 80 geometric shapes. The app supports both metric and imperial units and conveniently displays the formulas used. Fill your shape with solids or liquids, choosing from 1500 different materials, to calculate the weight.

**Healthcare Materials**

View a quick and easy overview of the compatibility of 34 materials with 35 chemical environments that are commonly encountered in the healthcare and medical industries. Select up to 20 materials and environments at once to produce a chart rating each material from "excellent" to "not recommended".

**Sealing Materials Selector**

Enter material specifications and required parameters, such as application temperature or hardness, to receive instant material proposals. The app features filters to limit searches based on chemical compatibility, institute approvals and product type and data sheets can be requested from within the interface.

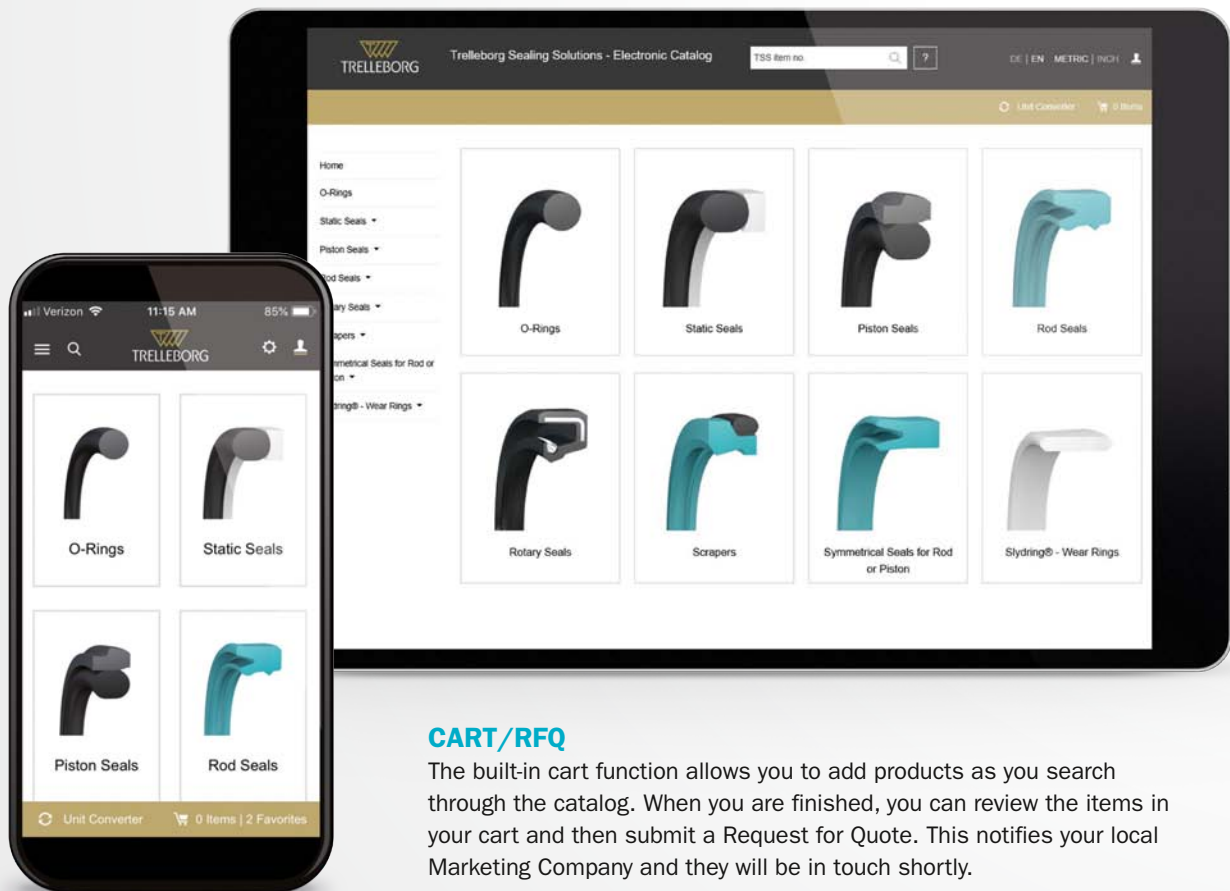

# Electronic Catalog

Discover the Electronic Catalog online as an app or on our website

The Electronic Catalog is a user-friendly service that connects you to the broad range of products Trelleborg Sealing Solutions offers. The products are arranged based on product type and product group, making it easy to find the exact one you need.

Many functions are also included within the Electronic Catalog that allow you to understand product capabilities, compare similar seals, request a quote and much more. The Electronic Catalog is available from the Trelleborg Sealing Solutions website and in the App Store and GooglePlay for mobile use.

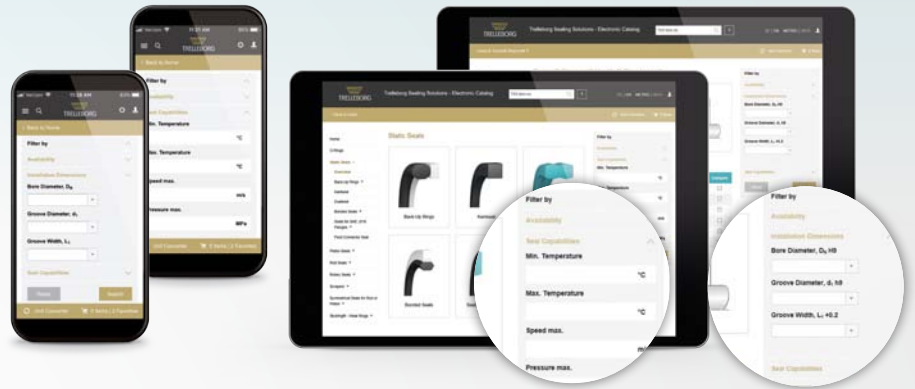

## CART/RFQ

The built-in cart function allows you to add products as you search through the catalog. When you are finished, you can review the items in your cart and then submit a Request for Quote. This notifies your local Marketing Company and they will be in touch shortly.

### FILTERING

If you have specific operating conditions that the seal must meet and/or installation dimensions, the Electronic Catalog offers a filtering function within the product groups. Here you can input your temperatures, pressure, speed and various installation dimensions to filter products that can meet your needs.

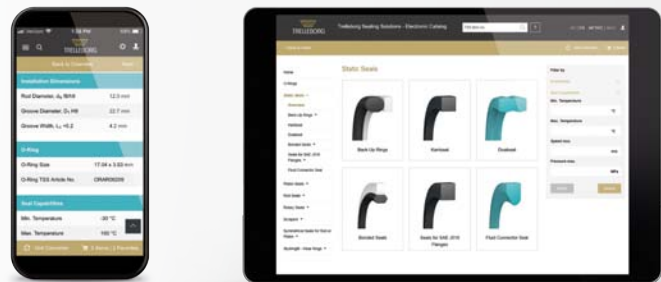

### PRODUCT COMPARISON

When looking through the catalog, you can choose to compare multiple products. The product comparison function allows you to select which products you are interested in, and then puts all relevant information into a table for your review. You can even choose to display all product details side by side or to only show the fields where they differ.

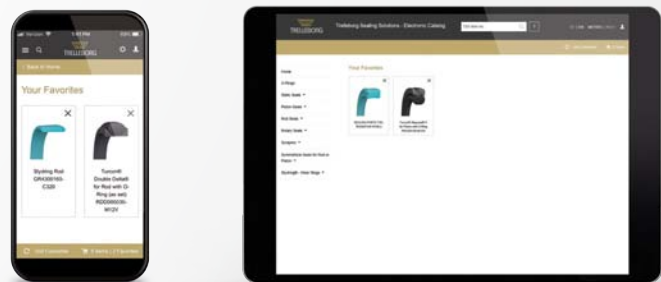

### PRODUCT INFORMATION

Detailed product information is available for each part number. Once you select a specific part number, you will be able to see its installation dimensions, seal capabilities, related catalogs and other information. From this page, registered users can access the material data sheets that are applicable to the part number.

### ADD TO FAVORITES

Do you have a part that you frequently look up or need information on? You can now save any of our part numbers as a favorite that is linked to your account. Anytime you log in to the Electronic Catalog, your favorites will be a click away!

### UNIT CONVERTER

If you are looking at a product and need to know the conversion between metric and imperial, you can use the Unit Converter tool that is available at the top of the screen for web users and at the bottom for mobile.

Trelleborg is a world leader in engineered polymer solutions that seal, damp and protect critical applications in demanding environments. Its innovative solutions accelerate performance for customers in a sustainable way.

Trelleborg Sealing Solutions is a leading developer, manufacturer and supplier of precision seals, bearings and custom-molded polymer components. It focuses on meeting the most demanding needs of aerospace, automotive and general industrial customers with innovative solutions.
