“ATS” SUPPORT DISC SYSTEM

WITH INDIVIDUAL AND FORM-FIT VEHICLE ADAPTERS – IN PARTICULAR FOR ELECTRIC CARS

“ATS” support disc system with rim (patent pending) and form-fit coating in which the individual vehicle adapters can be moved back and forth. A special feature worth highlighting is the precise positioning of the adapters so as not to cause any interfering contours when lifting the battery.

Vehicles are not only lifted safely with MAHA's ATS, but also quickly and easily.

- Lifting of all types of vehicles, whether with a combustion engine or electric, regardless of their size or weight and taking into account the DIN EN 1493 standard for vehicle lifts
- Lifting regardless of vehicle design
- Precise support at the lifting points provided by the manufacturer, regardless of their shape (round, rectangular or other support systems), allows damage-free lifting
- Support disc with form-fit adapters for an optimal connection between vehicle and support arm ensuring 100% reliable engagement of the support arm restraint
- Quick and easy retrofitting of swing arm lifts
- Absolutely stable and safe thanks to a sophisticated plug-in system
- Durable support discs and form-fit vehicle adapters through the use of high-quality materials such as corrosion-resistant metals, plastics or aluminium

A particular plus for electric cars:

- Newly developed vehicle securing system with lashing straps for removing the traction battery
- The precise support ensures that the traction battery remains undamaged

Support disc system (ATS) with plug-in system for swing arms or rubber discs (120 mm).

Form-fit support adapters to suit the vehicle type.

Vehicle securing system with lashing straps.
