D2C – Designed to Customer

The principle of Designed to Customer describes the recipe for success of REICH-KUPPLUNGEN: Utilizing our product knowledge, our customers are supplied with couplings which are developed and tailor-made to their specific requirements. The designs are mainly based on modular components to provide effective and efficient customer solutions. The unique form of close cooperation with our partners includes consultation, design, calculation, manufacture and integration into existing environments. Adapting our manufacturing to customer-specific production and utilizing global logistics concepts provides better after sales service - worldwide. This customer-oriented concept applies to both standard products and production in small batch sizes.

The company policy of REICH-KUPPLUNGEN embraces, first and foremost, principles such as customer satisfaction, flexibility, quality, prompt delivery and adaptability to the requirements of our customers.

REICH-KUPPLUNGEN supplies not only a coupling, but a solution: Designed to Customer.

Edition March 2013

General technical description

MULTI MONT couplings have been built in series since 1958. This pluggable claw coupling that has been successfully proven over a number of decades has been permanently updated to the state of the art, and the MULTI MONT SELLA, MULTI MONT DEKA and MULTI MONT GIANT series nowadays cover a torque range from 40 to 1 000 000 Nm.

The MULTI MONT product line offers a large variety of different types so that a suitable coupling is available for almost every type of power transmission requirement.

MULTI MONT SELLA nominal torques from 40 to 30 000 Nm

The MULTI MONT SELLA standard series comprises a number of different types. All coupling types allow changing the flexible transmission elements with no need for axial movement of a coupled machine part.

The flexible element for the coupling sizes up to and including MMS 63 consists of a split toothed ring which has the single rubber dampers attached to an external belt. All larger coupling sizes are equipped with 6 single saddle elements each for transmission which have two rubber dampers attached to the external belt.

The coupling is fitted with a separately screwed-on retaining cap which encloses the periphery of the rubber elements. This screwed connection is not involved in torque transmission. The elements of all coupling sizes can be fitted and removed radially after the retaining caps have been released and withdrawn.

MULTI MONT DEKA

nominal torques from 40 000 Nm to 100 000 Nm

The MULTI MONT DEKA coupling series that is made of spheroidal cast iron as a standard is not only of extremely compact design but also offers a high transmission rate.

The flexible transmission elements are fixed in pockets. During torque transmission, two elements totalling 40 are always subjected simultaneously to compression by one coupling claw.

Using the flange version the flexible transmission elements can be fitted and removed radially.

MULTI MONT GIGANT

nominal torques from 40 000 Nm to 1 000 000 Nm

Standardly made of spheroidal cast iron the MULTI MONT GIGANT coupling is available for highest torques up to 1 000 000 Nm.

The MULTI MONT GIGANT uses 6 single saddle elements.

The separate retaining cap allows radial fitting of the flexible elements with no need for axial movement of a coupled machine part.

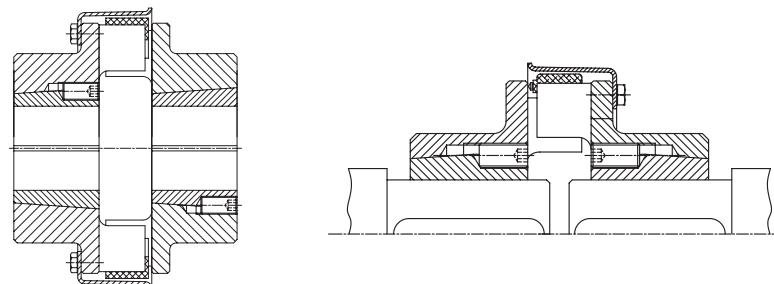

The most important attributes and advantages of MULTI MONT -SELLA, -DEKA, -GIGANT:

- compensate for axial-, radial- und angular misalignments
- absorb shocks and vibrations
- are fail-safe and withstand high overloads
- are well suited as plug-in type couplings ensuring ease of assembly and alignment
- allow prompt and easy radial change of the flexible elements by sliding back the retaining cap
- are maintenance-free
- are customizable for almost every type of mounting situation
- easy and simple assembly of the shaft connections thanks to taper bushes

Standard types

Claw coupling

Equipped with a taper bush as a connection element for the shaft. The taper bush is bolted in place in the coupling hub so that a shrink-fit-like connection free from backlash is established between the coupling hub and the shaft after assembly.

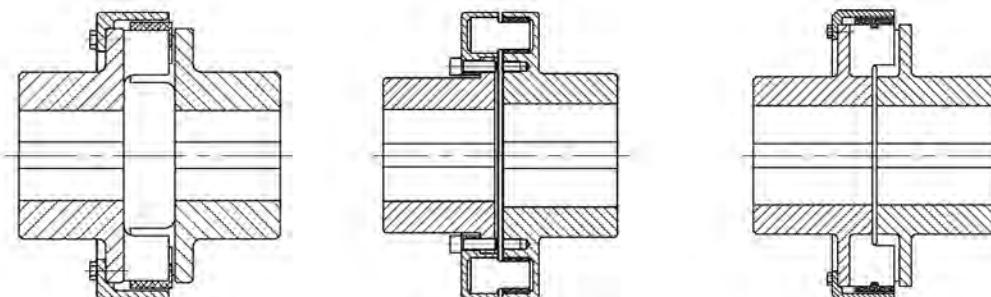

Series: MMS ... T
up to 12 500 Nm)

Shaft couplings

Standard version for connecting two shafts.

The separately screwed-on retaining cap allows changing the flexible elements with no need for axial movement of either of the coupling hubs.

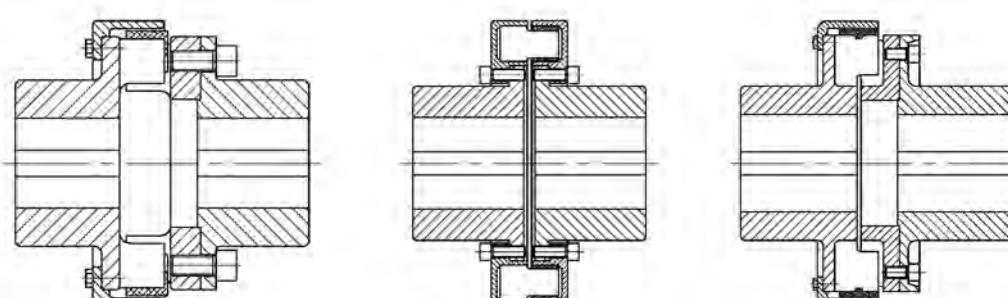

Series: MMS ... W
up to 30 000 Nm MMD ... WK
up to 100 000 Nm MMG ... W
up to 1 000 000 Nm

Separable flange couplings

This version allows radial assembly of the coupled machines with no need for their axial movement.

The separately screwed-on retaining cap allows changing the flexible elements with no need for axial movement of either of the coupling hubs.

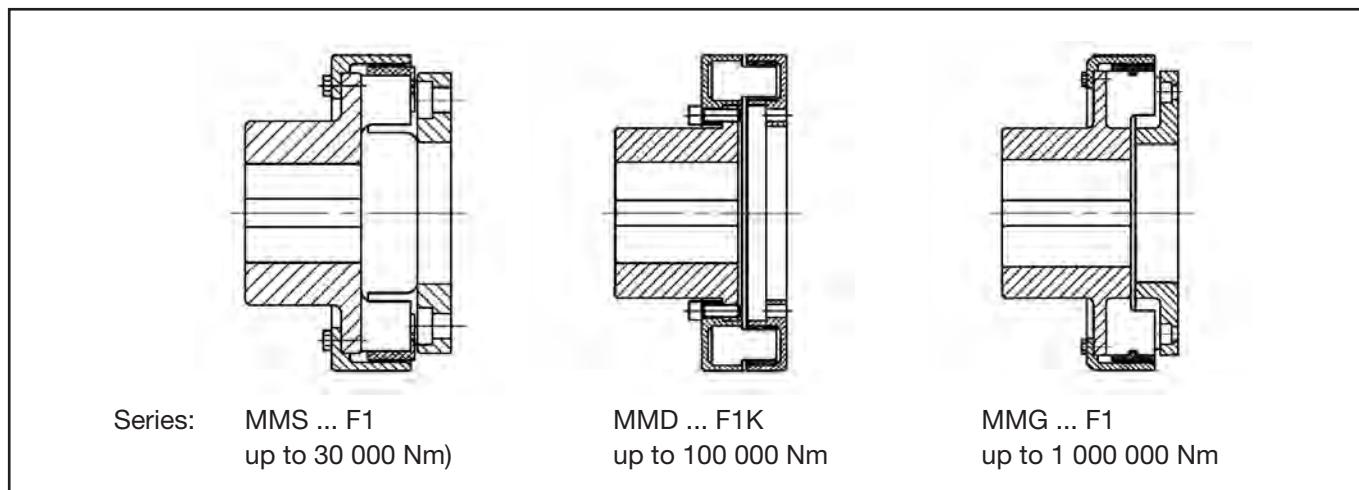

Series: MMS ... T
up to 30 000 Nm MMD ... TK
up to 100 000 Nm MMG ... T
up to 1 000 000 Nm

Standard types

Flange couplings

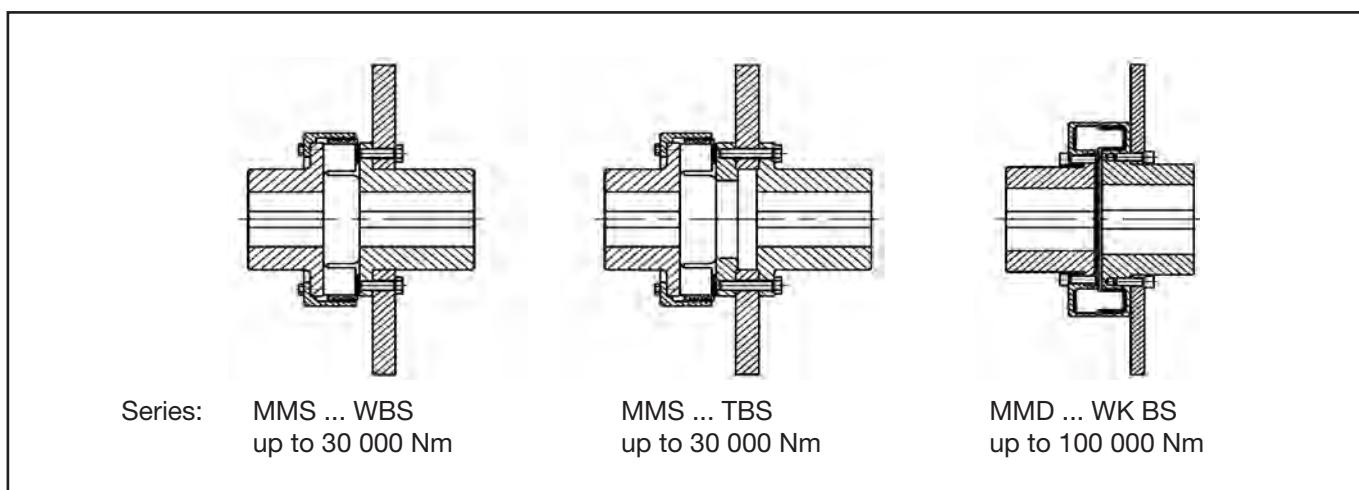

For flange-mounting to discs and flywheels.

The separately screwed-on retaining cap allows changing the flexible elements with no need for axial movement of either of the coupling hubs. Different mounting options are available by the use of intermediate flanges.

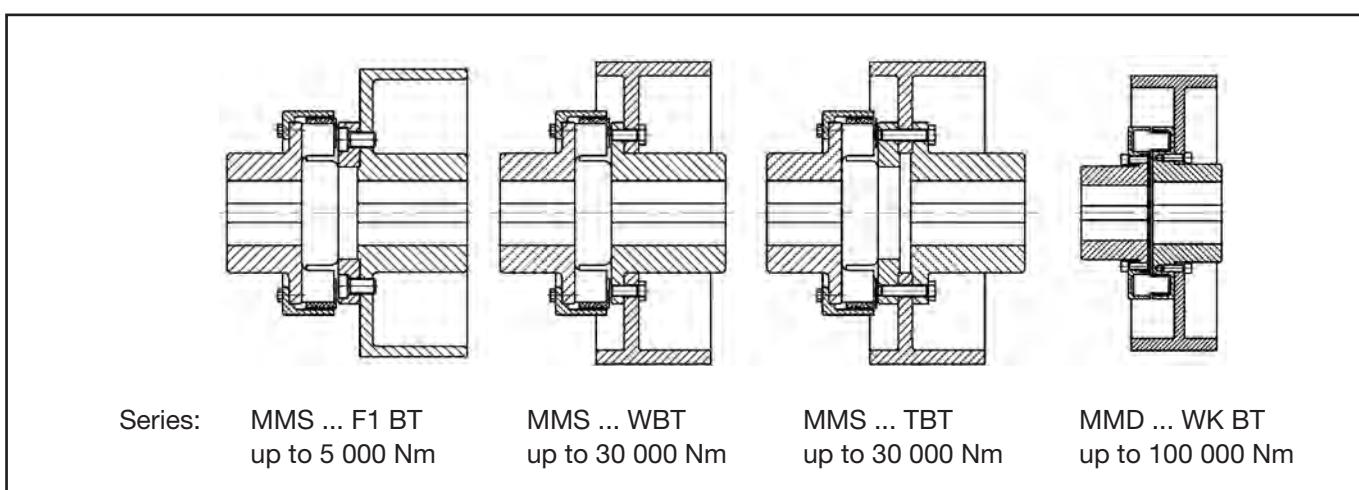

Brake disc couplings

With brake discs for disc clamps. The separable flange coupling TBS allows radial fitting and removal of the brake disc.

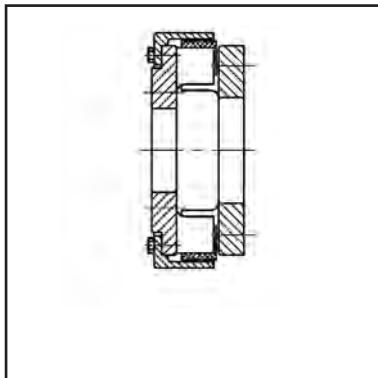

Brake drum couplings

With brake drums for external shoe brakes. Leading dimensions of the brake drum acc. to DIN 15 431.

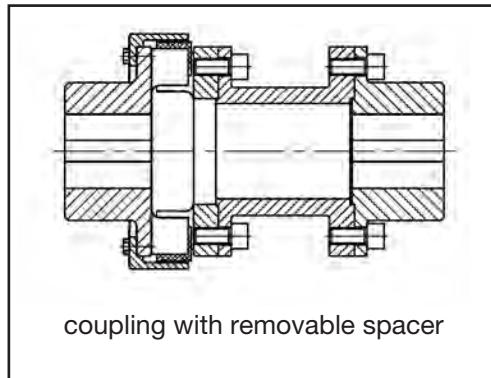

Special types

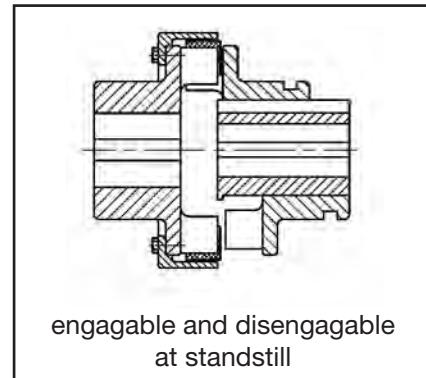

Double flange couplings

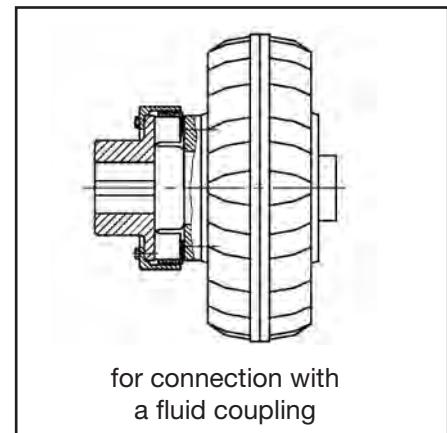

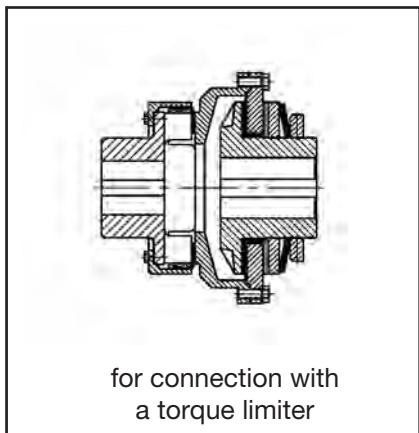

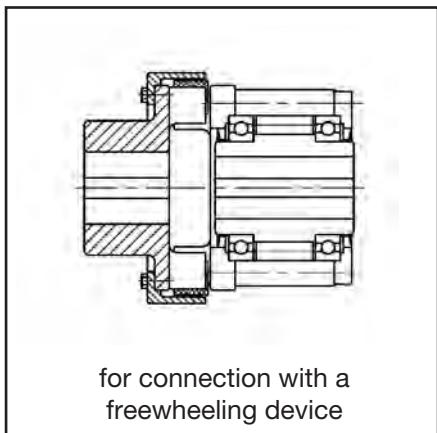

Spacer couplings

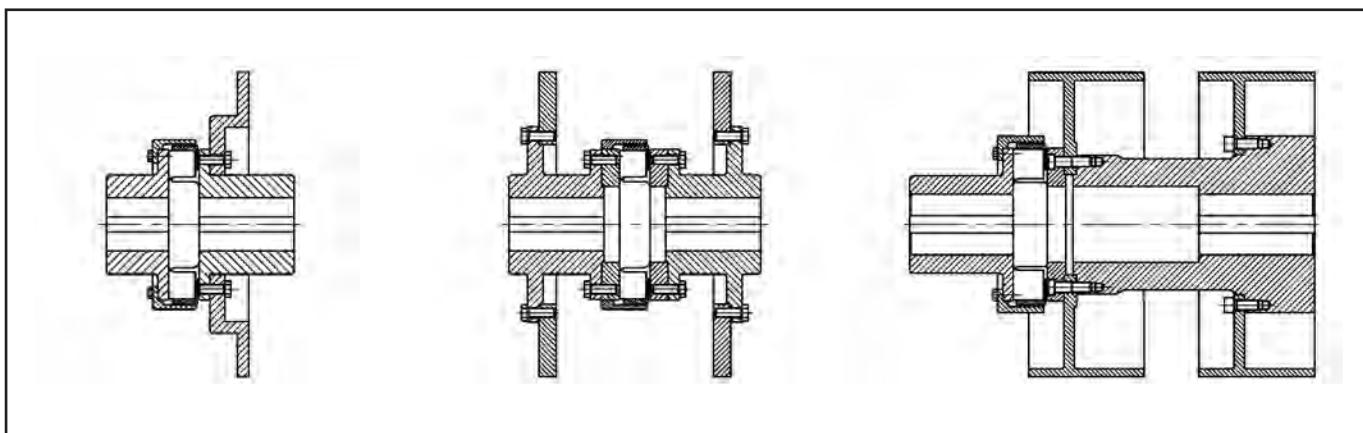

Clutches

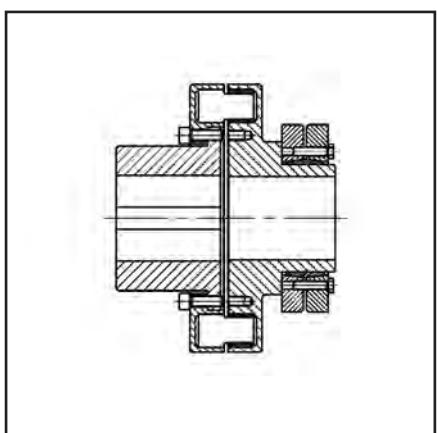

Combination couplings

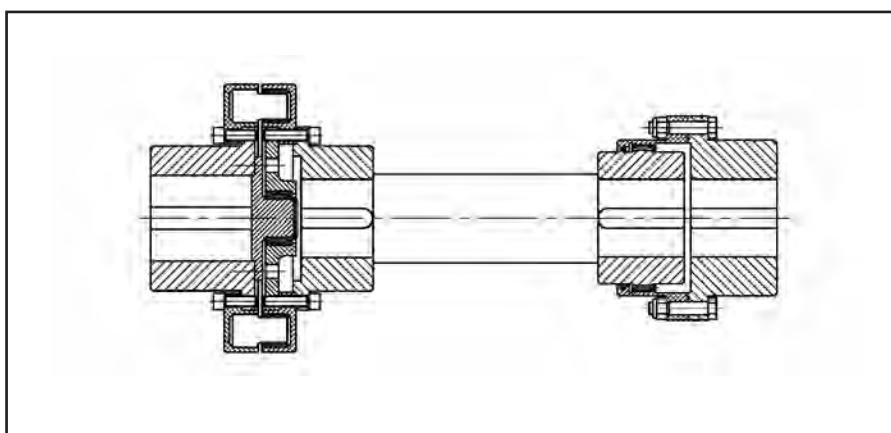

Brake disc and brake drum coupling versions

Versions with shrink disc

Versions with intermediate shaft in combination with a gear coupling

Materials

Standard coupling hubs of grey cast iron are used unless specified otherwise. Other materials are available as an option.

Material designation	Code	Permissible temperature range shortly	Feature
for standard versions: natural/synthetic rubber mixture hardness range: 75 – 80° Shore A	SN	- 40 °C to 80 °C 90 °C	excellent abrasion resistance
nitrile rubber (NBR) hardness range: 73 – 78° Shore A	SP	- 40 °C to 100 °C 120 °C	mineral oil resistance and motor fuel resistance
silicone (VMQ) hardness range: 70 – 75° Shore A	SX	- 70 °C to 120 °C 140 °C	high temperature resistance
polyurethane (PUR) hardness range: 90 – 95° Shore A	UD	- 30 °C to 120 °C 170 °C	high strength excellent abrasion resistance

Technical details of the MULTI MONT couplings with elements made of NBR and VMQ on request.

Other rubber materials and other shore hardnesses can also be supplied on request.

Balancing

All MULTI MONT couplings are of balancing quality G =16 for n =1500 rpm acc. to ISO 1940 as a standard which is sufficient for normal speed ranges. If a superior balancing quality is required, the coupling components can also be dynamically balanced. In such a case please advise the rotational speed and whether the hubs shall be balanced with or without keyway when placing your order.

Selection of the proper coupling size

The coupling size should be adequately dimensioned to ensure that the permissible coupling load is not exceeded in any operating condition encountered. For drives which are not subjected to periodically recurring vibratory torque loads, the coupling design may be selected based on the driving torque with reference to the corresponding service factors.

For drives with combustion engines or prime movers which are subject to periodically recurring vibratory torques, the final selection of the coupling should be verified by a full torsional vibration analysis which will be conducted by us on request.

- Calculate the driving torque T_{AN}

Given a driving power P_{AN} and a coupling speed n_{AN} , the driving torque is calculated as follows

$$T_{AN} [\text{Nm}] = 9550 \frac{P_{AN} [\text{kW}]}{n_{AN} [\text{rpm}]}$$

- The nominal torque capacity T_{KN} of the coupling shall be at least equal to the max. drive torque T_{AN} while taking the service factors into account
- The maximum torque capacity T_{Kmax} of the coupling shall be at least equal to the highest torque T_{max} encountered in operation while taking the temperature factor S_t into account
- The torsional vibration analysis to verify the coupling selection should confirm that the permissible continuous vibratory torque under reversing stresses T_{KW} is at least equal to the highest vibratory torque under reversing stresses T_W encountered throughout the operating speed range while taking into account the temperature and frequency
- The frequency factor S_f allows for the frequency dependence of the permissible continuous vibratory torque under reversing stresses T_{KW} (10 Hz) when operating with a different frequency f_x

$$T_{KN} \geq T_{AN} \cdot S_m \cdot S_t \cdot S_z$$

$$T_{Kmax} \geq T_{max} \cdot S_t$$

$$T_{KW} (10 \text{ Hz}) \geq T_W \cdot S_t \cdot S_f$$

$$S_f = \sqrt{\frac{f_x}{10}}$$

Service factors

For couplings with silicon elements SX please take account of the load factors for heavy load S .

Load factor S_m

Prime mover	Load factor of the driven machine		
	U	M	H
Electric motors, turbines, hydraulics motors	1.25	1.6	2.0
Combustion engine \geq 4-cylinder Cyclic irregularity \geq 1:100	1.5	2.0	2.5

Temperature factor S_t

Ambient temperature	-40 °C +30 °C	+40 °C	+60 °C	+80 °C	> +80 °C
S_t	1.0	1.1	1.4	1.8	on request

Start-up factor S_z

Starts per hour	30	60	120	240	> 240
S_z	1.0	1.1	1.2	1.3	on request

U = uniform load M = medium load H = heavy load

Calculation example

A coupling is required between an electric motor ($P = 450 \text{ kW}$ at $n = 980 \text{ rpm}$) and a gearbox of a belt conveyor drive.

$$T_{AN} = 9550 \frac{450 \text{ kW}}{980 \text{ rpm}} = 1559 \text{ Nm}$$

Uniform load	= U : $S_m = 1.25$
Ambient temperature	40°C : $S_t = 1.1$
Starting frequency	$30/\text{h}$: $S_z = 1.0$

$$\begin{aligned} T_{KN} &\geq T_{AN} \cdot S_m \cdot S_t \cdot S_z \\ T_{KN} &\geq 1559 \text{ Nm} \cdot 1.25 \cdot 1.1 \cdot 1.0 = 6029.7 \text{ Nm} \end{aligned}$$

Selected coupling: MMS 630 SN W at $T_{KN} = 6300 \text{ Nm}$

Assignment of the load classification factors to the type of driven machine

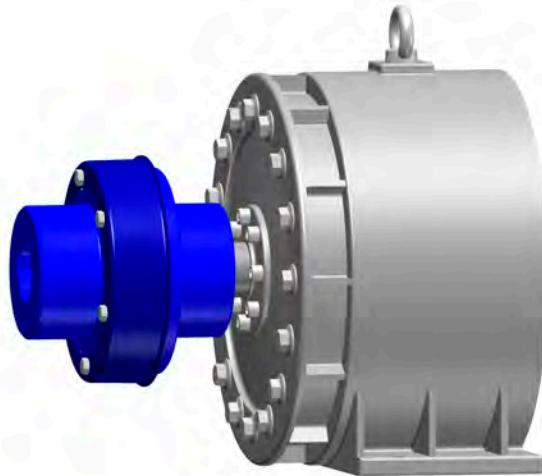

U = uniform M = medium shock H = heavy shock
load load load

For drives with periodic excitation of the plant, the coupling selection shall be verified by means of a full torsional vibration analysis.

*) For this power range ask for catalogue "MULTI MONT ASTRA"

The assignment takes the maximum hub bore of the couplings into account and provides adequate safety for normal load applications at a load classification factor $S_m = 1.25$. For other loads the design needs to be calculated according to "Selection of the proper coupling size" (see pages 8 and 9).

MULTI MONT SELLA – with taper bush

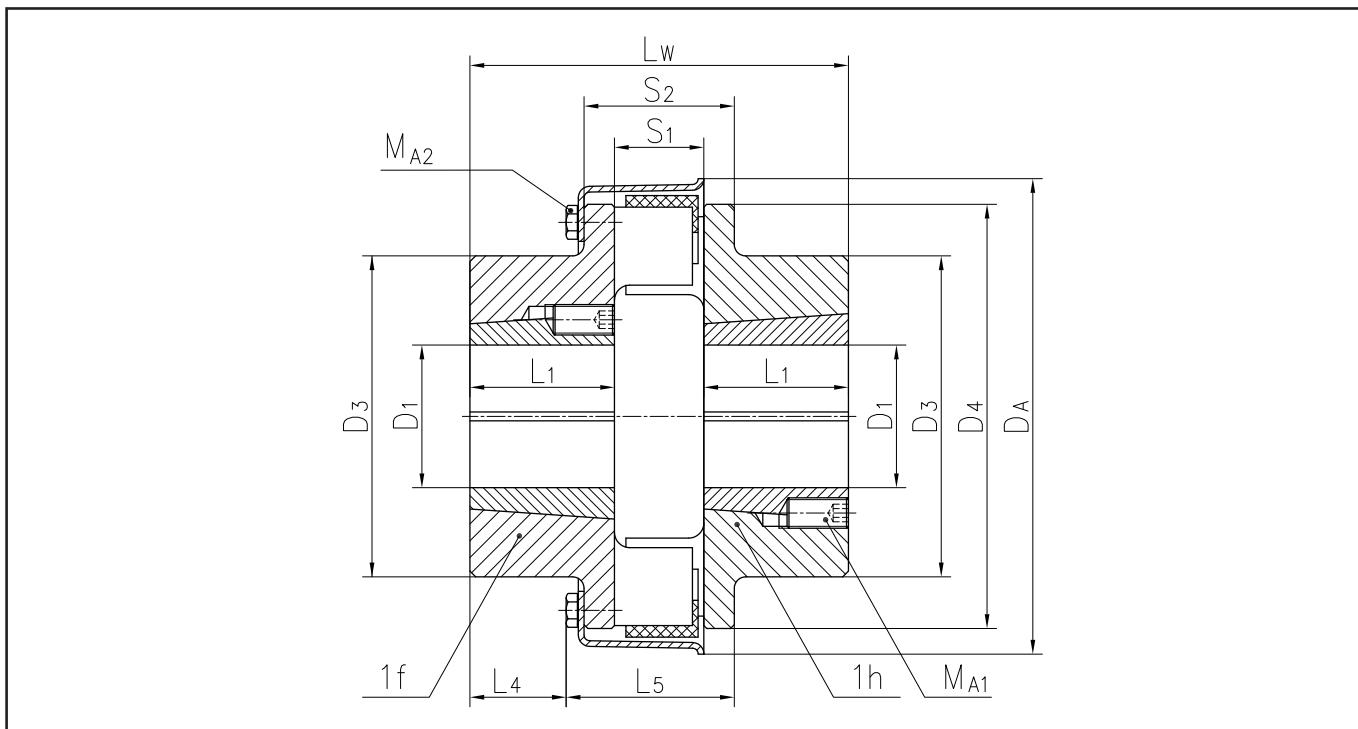

Series MMS-T...W

The MULTI MONT SELLA claw coupling of type MMS-T... is equipped with a taper bush as a connection element for the shaft. The taper bush is bolted in place in the coupling hub so that a shrink-fit-like connection free from backlash is established between the coupling hub and the shaft after assembly.

Due to the use of commercially available taper bushes with a number of different bore dimensions, the need for finishing the bore and keyway of the coupling hub is omitted for the MULTI MONT SELLA coupling type MMS-T. Assembly and disassembly are possible with no need for special tools!

The maximum torque depends on the respective taper bush.

Furthermore the maximum torque is limited to two times of nominal torque.

MULTI MONT SELLA – shaft couplings

Series MMS ... W

Standard version for connecting two shafts.

The flexible elements can be easily accessed and removed radially with no need for axial movement of the coupled machines after the retaining cap has been released and withdrawn.

MULTI MONT SELLA – separable shaft couplings

Series MMS ... T

This version allows radial assembly of the coupled machines with no need for their axial movement.

The separately bolted on retaining cap allows changing the flexible elements with no need for axial movement of either of the coupling hubs.

MULTI MONT GIGANT standard types

Designed as shaft and flange couplings

The flexible elements can be easily accessed and removed radially with no need for axial movement of the coupled machines after the retaining cap has been released and withdrawn.

The flanges are supplied without connection bores as a standard. If requested, the flanges can be designed with connection bores for socket head screws or threads acc. to specification on a pitch circle diameter D_6 .

The specified values apply to hubs with medium-sized bore diameters

Mounting instructions and alignment tolerances

The specified alignment tolerances should only be considered as approximate values in order to keep the assembly work involved within reasonable limits and in view of the fact that the compensating capability of the coupling depends to a large extent on the rotational speeds and loads applied. Precise alignment of the coupling halves contributes to a long service life of the flexible coupling elements.

How to mount the flexible elements and the retaining cap

When mounting the flexible elements care shall be taken to ensure that the coupling halves are not mounted too close to each other in order to protect the flexible elements from being subjected to lateral pressure and to maintain the axial flexibility of the coupling in operation. Likewise, the coupling halves shall not be mounted too far from each other so that the rubber blocks are capable of transmitting over the entire width between the coupling claws.

For easier positioning of the retaining cap when the saddle elements are inserted we recommend to previously coat their periphery with talcum or soft soap (no grease or oil). A threaded rod may be used as an aid for pushing the retaining cap into position.

Mounting instruction for type MMS-T...W with taper bush.

Mounting the element hub with taper bush. The general mounting instruction for the MMS also applies to this instruction and is to be equally taken into account.

1. The outer taper of the taper bush and the bore with the inner taper of the element hub shall show bright metal and must be free of grease prior to mounting.

Preservatives must be removed completely.

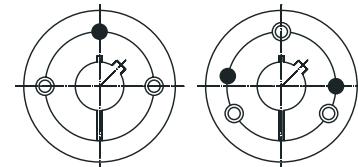

Fig. 1

2. Insert the taper bush into the element hub and line up all connecting bores. Make sure that half threaded holes coincide with half plain bores (Fig. 1).

No. 1610
2012
2517
3030

No. 3535
4040
4545

3. Screw in lightly greased or oiled assembly screws.
Do not tighten the screws yet (Fig. 2).

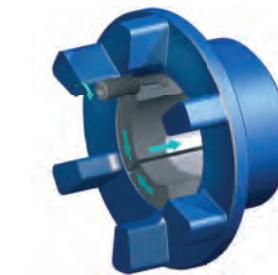

Fig. 2

4. Slide the element hub with inserted taper bush onto the cleaned shaft with key. Put it into the mounting position and tighten it uniformly according to Fig. 3 and Table 1.
5. The screws can be retightened again by slight tapping against the taper bush with a hammer using an intermediate plate. Repeat this process, if necessary.

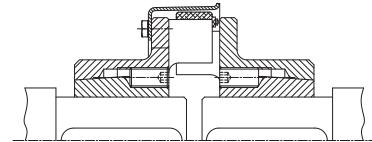

Fig. 3

Dismantling the element hub with taper bush

1. Loosen and remove all screws. Depending on the taper bush size, screw either 1 or 2 greased screws into the half pulling-off thread(s) of the taper bush (Fig. 4).

Fig. 4

2. Tighten the screws uniformly until the taper bush is loose in the element hub.
3. As soon as the taper bush is loose, the element hub can be pulled off the shaft together with the taper bush.

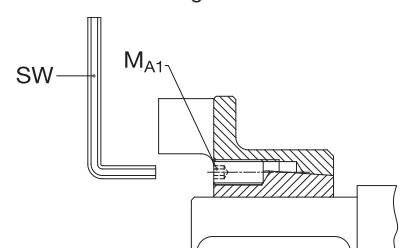

Table 1

Screw tightening torques for mounting the taper bush

Screwed connections of the coupling

Before starting initial operation, all screws of the coupling have to be checked for their correct tightening torque using a torque wrench. Only correctly tightened screws are secured against loosening. If an additional screw lock is required we recommend to use anaerobic adhesives (e.g. Loctite or equivalent).

Tightening torques for screws with metric threads and head contact according to DIN 912, 931, 6912, grade 8.8

Screw size	M 6	M 8	M 10	M 12	M 16	M 20	M 24	M 27	M30
Tightening torque Nm	10	25	49	86	210	410	710	1050	1450

Technical note

The technical data applies only to the complete coupling or the corresponding coupling elements. It is the customer's/user's responsibility to ensure there are no inadmissible loads acting on all the components. Especially existing connections, like bolt connections, have to be checked regarding the transmittable torque, if necessary other measures, e.g. additional reinforcement by pins, may be required. It is the customer's/user's responsibility to make sure the dimensioning of the shaft and keyed or other connection, e.g. shrinking or clamping connection, is correct.

REICH-KUPPLUNGEN have an extensive programme of couplings and coupling systems to cover nearly every drive configuration. Furthermore customized solutions can be developed and be manufactured also in small series or as prototypes. Calculation programmes are available for coupling selection and sizing. - Please challenge us!

Safety precautions

**It is the customer's and user's responsibility to observe the national and international safety rules and laws.
Proper safety devices must be provided for the coupling to prevent accidental contact.**

Check all bolted connections for the correct tightening torque and fit after a short running period preferably after a test run.
