

SANDING BRUSHES

Finding the right abrasive is one of the most important choices to be made when selecting the right sanding brush. As an independent producer of sanding brushes we are constantly working closely together with the abrasive manufactures so, therefore, we always have access to the latest developments from the abrasive industry.

SANDING BRUSHES

Generally, we work with multiple types of grits, such as aluminium oxide, silicon carbide, zirconium, ceramics and diamond.

Besides the abrasive, our sanding brushes contain fibres. Typically we work with natural fibres – either from plants or animals. By using natural fibres, we ensure the best possible sanding, plus we ensure sustainable production.

The construction of our sanding brushes also ensures that there will be no problem with static electricity.

The last important thing to pay attention to when searching for the right configuration of the sanding brushes is the cut sizes and the combination of those. Flex Trim has very modern production facilities, which makes more or less everything possible. We work with the following standard cut sizes:

4.5 mm – 6.7 mm – 20 mm and no cut

These cuts are often combined with 2 or more different cuts in the same core.

Other brush heights, cut sizes and types of fibres are available on request.

Our brushes are available in the following standard heights:

Tampico	Black fibres	Horse hair	Pig hair
30 mm	30 mm	45 mm	35 mm
40 mm	40 mm		
45 mm	45 mm		
55 mm	55 mm
