DESIGN REGISTERED

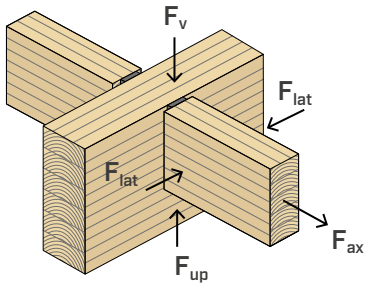
ETA-23/0824

SERVICE CLASS SC1 SC2 SC3

MATERIAL

alu 6082 EN AW-6082 aluminium alloy

EXTERNAL LOADS



POST AND BEAM CONSTRUCTIONS

It standardizes the beam-to-beam and beam-to-column connections for post-and-beam systems, even with large spans. Modular components and various fastening possibilities solve all types of connections on timber, concrete or steel.

TOLERANCE AND ASSEMBLY

Axial tolerance up to 8 mm (±4 mm) to accommodate installation inaccuracies. The upper notch allows using a bolt as a positioning aid. The connection can be pre-assembled in the factory and completed on site with bolts.

ROTATIONAL COMPATIBILITY

Slotted holes allow rotation of the connector and ensure hinged structural behaviour. The rotation of the connector is compatible with the inter-story drift caused by earthquake and wind actions, reducing momentum transfer and structural damage.

USA, Canada and more design values available online.

HP

HV

JV

JS

FIELDS OF USE

Concealed joint for beam in timber-to-timber, timber-to-concrete or timber-to-steel configuration, suitable for floors and post and beam constructions, even with large spans. Use also outdoors in non aggressive environments.

Can be applied to:

- glulam, softwood and hardwood
- LVL

FIRE

The multiple installation methods allow for concealed installation and fire protection at all times, possibly by inserting FIRE STRIPE GRAPHITE to seal the joist-header interface.

HYBRID STRUCTURES

The HP version can be fixed on timber, concrete or steel. Ideal for hybrid timber-to-concrete or timber-to-steel structures.

CODES AND DIMENSIONS

HP - main element connector (**H**EADER) for timber (HBS**P** screws), concrete and steel

CODE	B x H x P [mm]	*B x H x P [in]*	pcs

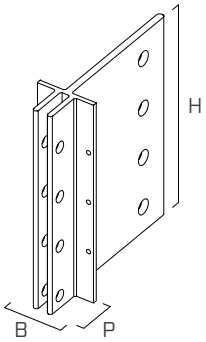
ALUMEGA840JS	68 x 840 x 49	*2 11/16 x 33 1/16 x 1 15/16*	1



The connectors can be cut in multiples of 60 mm, respecting the minimum height of 240 mm.
For example, it is possible to obtain two ALUMEGA JV connectors with H = 300 mm from the ALUMEGA600JV connector.

CONNECTION BETWEEN CONNECTORS

Make sure that the **JV** and **JS** connectors are correctly installed to the secondary beam, referring to the "**TOP**" marking on the product.

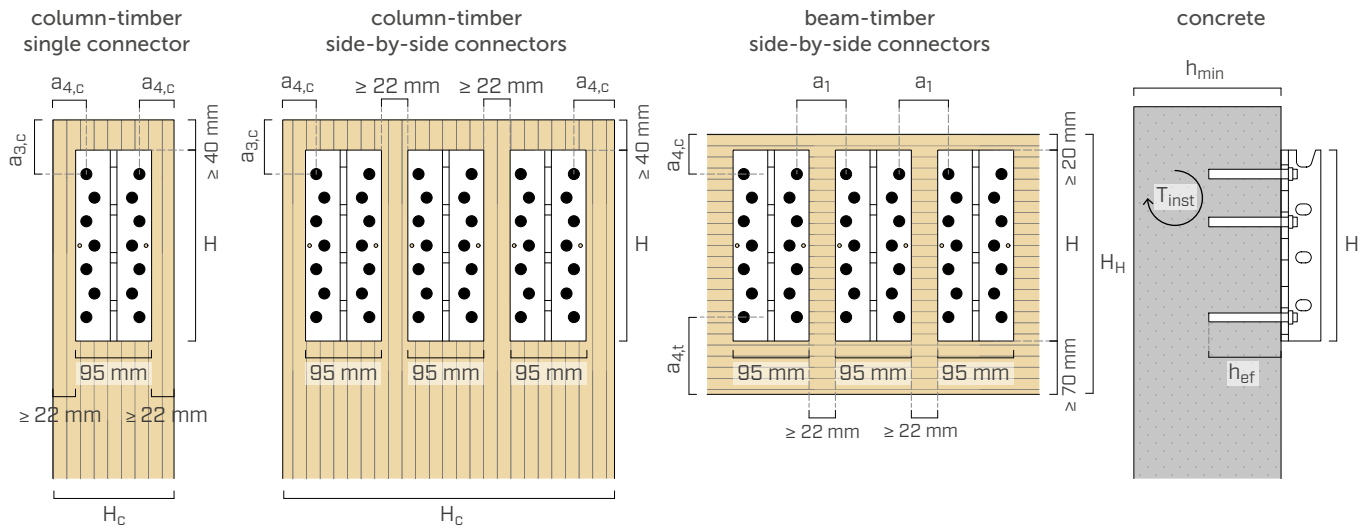
MINIMUM DISTANCES AND DIMENSIONS



Primary beam height $H_H \geq H + 90$mm, where H is the connector height.
The spacing between connectors refers to timber elements with density $\rho_k \leq 420$ kg/m^3, screws inserted without pre-drilling hole and for stresses F_v and F_{up}. For other configurations refer to ETA-23/0824.

ALUMEGA HP - minimum distances

ALUMEGA HV - side-by-side connectors

			single connector	double connector	triple connector
column width	H_c	[mm]	132	237	342

NOTES

- The distances $a_{1,CG}$ and $a_{2,CG}$ refer to the centre of gravity of the threaded part of the screw in the timber element.
- In addition to the stated minimum distances $a_{1,CG}$ and $a_{2,CG}$, it is recommended to use a $c_w \geq 10$ mm timber cover.
- The minimum length of VGS screws is 180 mm.
- The spacing between connectors refers to timber elements with density $\rho_k \leq 420$ kg/m^3, screws inserted without pre-drilling hole and for stresses F_v, F_{ax} and F_{up}. For other configurations refer to ETA-23/0824.

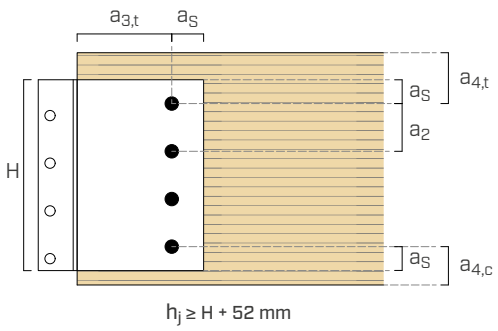
NOTES

- The distances $a_{2,CG,J1}$ and $a_{2,CG,J2}$ refer to the centre of gravity of the threaded part of the screw in the timber element.
- In addition to the minimum distance $a_{2,CG,J1}$ indicated, it is recommended to use a $c_w \geq 10$ mm timber cover.
- The minimum length of VGS screws is 180 mm.
- The spacing between connectors refers to timber elements with density $\rho_k \leq 420$ kg/m^3, screws inserted without pre-drilling hole and for stresses F_v, F_{ax} and F_{up}. For other configurations refer to ETA-23/0824.

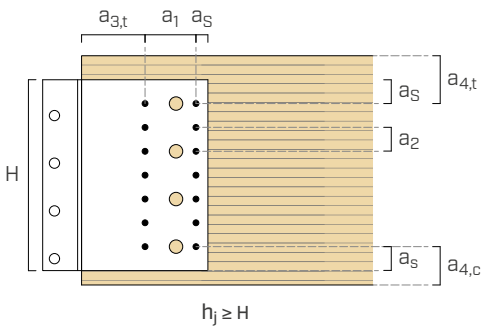
INSTALLATION | **ALUMEGA JS**

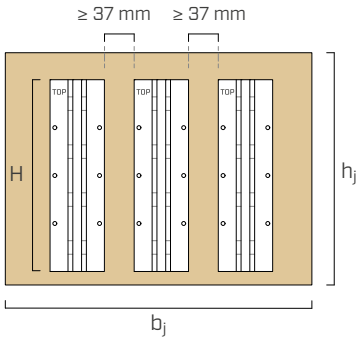
MINIMUM DISTANCES AND DIMENSIONS

STA smooth dowel Ø16



self-drilling dowel SBD Ø7,5



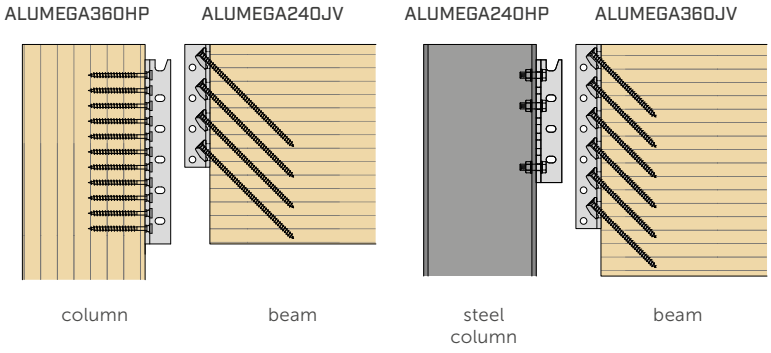


Spacing between ALUMEGA JS side-by-side ≥ 37 mm meets the minimum spacing requirement of 10 mm between HV connectors on beam and column. If the JS connector is attached to an HP connector on beam and column, the minimum spacing between connectors is 49 mm.

secondary beam-timber				**SBD Ø7,5**	**STA Ø16**
dowel-dowel	a_1[(1)]	[mm]	≥ 3·d | ≥ 5·d	≥ 23 | ≥ 38	-
dowel-dowel	a_2	[mm]	≥ 3·d	≥ 23	≥ 48
dowel-beam end	$a_{3,t}$	[mm]	max (7 d; 80 mm)	≥ 80	≥ 112
dowel-top of beam	$a_{4,t}$	[mm]	≥ 4·d	≥ 30	≥ 64
dowel-bottom of beam	$a_{4,c}$	[mm]	≥ 3·d	≥ 23	≥ 48
dowel-bracket edge	a_s[(2)]	[mm]	≥ 1,2·d_0[(3)]	≥ 10	≥ 21

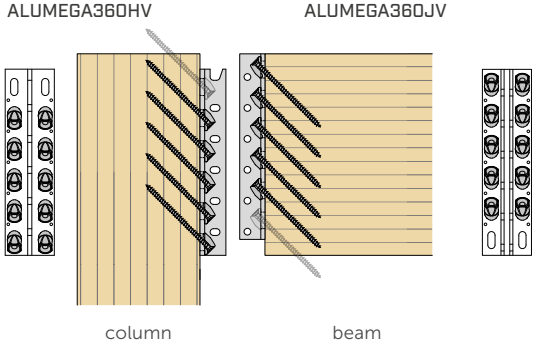
(1)Spacing between SBD dowels parallel to the fibre for load-to-grain angle α = 90° (F_v or F_{up} stress) and α = 0° (F_{ax} stress) respectively.
(2)It is advisable to pay special attention to the positioning of the SBD dowels with respect to the distance from the bracket edge, using a pilot hole if necessary.
(3)Hole diameter.

ASSEMBLY OF CONNECTORS OF DIFFERENT HEIGHTS



A secondary beam connector (JV and JS) may be attached to a main element connector (HV and HP) of a different height. The configurations shown allow for balancing the strengths between the HP and JV connectors, and limit the extension of the inclined screws beyond the outline of the connectors (example on the left). The final strength is the minimum between the strength of the connectors and the bolts.

PARTIAL FASTENING FOR **HV** AND **JV** CONNECTORS



Partial fastening is permitted for the HV and JV connectors by omitting the first and last row of screws, respectively. This configuration is particularly favourable for beam-to-column connections, with the column extrados aligned with the beam extrados.

NOTES

- In the calculation, C25/30 concrete with thin reinforcement was considered in the absence of distances from the edge.
- Chemical anchor VIN-FIX according to ETA-20/0363 with threaded rods (type INA) of minimum steel class 8.8 with h_{ef} = 225 mm.
- The design values are according to EN 1992:2018 with α_{sus} = 0,6.
- The values in the table are design values referring to the dowelling patterns on page 102.
- Aluminium-side strength must be verified in accordance with ETA-23/0824.
- Refer to ETA-23/0824 for the calculation of $F_{ax,d}$, $F_{up,d}$ and $F_{lat,d}$.

NOTES

(1) For intermediate values of the screw length, it is possible to interpolate the resistance linearly.

(2) The $R_{v,k\ timber}$ and $Rup,k_{\ timber}$ strengths for partial fastening can be determined by multiplying by the following ratio: (number of screws for partial fastening)/(number of screws for total fastening).

(3) $F_{v,Ek}$ is the characteristic permanent action in the F_v direction. The design value is derived according to EN 1990 $F_{v,Ed} = F_{v,Ed} = F_{v,Ek}\cdot\gamma_{G,inf}\cdot$

(4) The test campaign for ETA-23/0824 resulted in the certification of all ALUMEGA HV and JV models with screw lengths up to 520 mm. To increase safety in the event of incorrect installation, the use of connectors with short screws is preferred. In any case, it is recommended to drill a guide hole with JIG VGU and insert screws with controlled torque (max. 20 Nm) using TORQUE LIMITER or BEAR torque wrench.

NOTES

- The values provided are calculated with a routing in the 12 mm thick timber.
- The values provided are in accordance with the patterns on page 105. For SBD dowels a_1 = 64 mm, $a_{3,t}$ = 80 mm, a_s = 15 mm (side bracket edge) and a_s = 30 mm (bottom/top bracket edge).
- STA smooth dowel Ø16: $M_{y,k}$ = 191000 Nmm.
- SBD self-drilling dowels Ø7,5: $M_{y,k}$ = 75000 Nmm.

GENERAL PRINCIPLES

- The dimensions indicated in the installation section are minimum dimensions of structural elements, for screws inserted without pre-drilling hole, and do not take fire resistance requirements into account.
- For the calculation process a timber characteristic density ρ_k = 385 kg/m^3 has been considered.
- The coefficients k_{mod}, γ_M and γ_{M2} should be taken according to the current regulations used for the calculation.
- Dimensioning and verification of timber and concrete elements must be carried out separately.
- Characteristic values are consistent with EN 1995-1-1, EN 1999-1-1 and in accordance with ETA-23/0824.
- The following verification shall be satisfied for combined loading:

$$\left(\frac{F_{ax,d}}{R_{ax,d}}\right)^2 + \left(\frac{F_{v,d}}{R_{v,d}}\right)^2 + \left(\frac{F_{up,d}}{R_{up,d}}\right)^2 + \left(\frac{F_{lat,d}}{R_{lat,d}}\right)^2 \leq 1$$

  $F_{v,d}$ and $F_{up,d}$ are forces acting in opposite directions. Therefore only one of the forces $F_{v,d}$ and $F_{up,d}$ can act in combination with the forces $F_{ax,d}$ or $F_{lat,d}$. Refer to ETA-23/0824 for the calculation of $F_{lat,d}$.
- The $F_{ax,d}$ strength is activated as a result of the initial sliding given by the slotted holes, refer to the TENSILE STRENGTH section on page 111.
- Refer to ETA-23/0824 for the sliding modulus.
- ETA-23/0824 does not cover eccentricity in F_v loads, which means the application of torque on the connection. Designers should evaluate whether to use an additional fastening system or ALUMEGA connectors placed side by side.

SIDE-BY-SIDE CONNECTORS

- Particular attention must be paid to alignment during installation, in order to avoid different stresses between connectors. The use of the JIGALUMEGA assembly template is recommended.
- The total strength of a connection consisting of up to three side-by-side connectors is the sum of the strength of the individual connectors.

ALUMEGA HP-ALUMEGA JS

- Design values can be obtained from characteristic values as follows:

$$R_{v,d} = min \begin{cases} \frac{R_{v,k\ timber} \cdot k_{mod}}{\gamma_M} \\ \frac{R_{v,k\ alu}}{\gamma_{M2}} \end{cases} \qquad R_{up,d} = min \begin{cases} \frac{R_{up,k\ timber} \cdot k_{mod}}{\gamma_M} \\ \frac{R_{up,k\ alu}}{\gamma_{M2}} \end{cases}$$

$$R_{ax,d} = min \begin{cases} \frac{R_{ax,k\ timber} \cdot k_{mod}}{\gamma_M} \\ \frac{R_{ax,k\ alu}}{\gamma_{M2}} \end{cases}$$

- For F_{ax} stresses, the splitting of the main beam or column caused by forces perpendicular to the fibre (ALUMEGA HP) must be checked separately.
- The end of the secondary beam must be in contact with the wing of the JS connector.

ALUMEGA HV-ALUMEGA JV

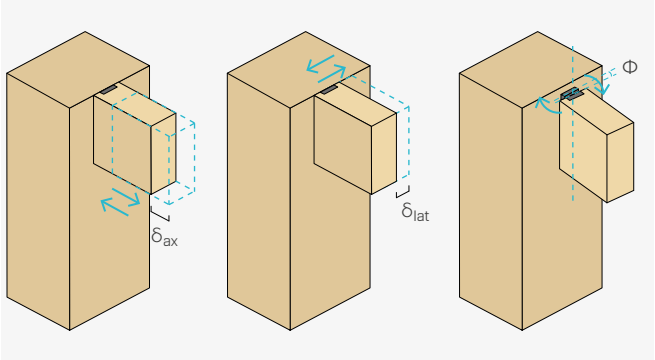
- Design values can be obtained from characteristic values as follows:

$$R_{v,d} = min \begin{cases} \frac{R_{v,k\ timber} \cdot k_{mod}}{\gamma_M} \\ \frac{R_{tens,45,k}}{\gamma_{M2}} \\ \frac{R_{v,k\ alu}}{\gamma_{M2}} \end{cases} \qquad R_{up,d} = \frac{R_{up,k\ timber} \cdot k_{mod}}{\gamma_M}$$

$$R_{ax,d} = min \begin{cases} \frac{R_{ax,k\ timber} \cdot k_{mod}}{\gamma_M} \\ \frac{R_{ax,k\ alu}}{\gamma_{M2}} \end{cases}$$

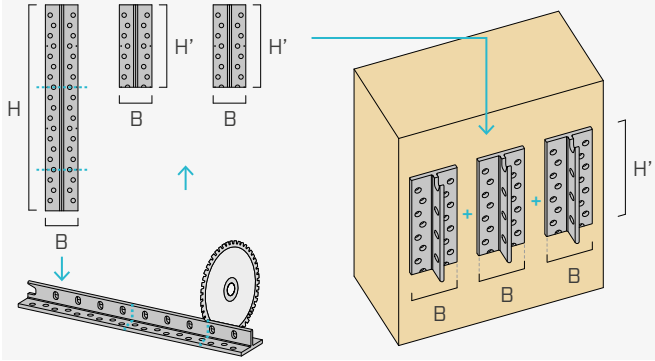
MAIN CHARACTERISTICS

ASSEMBLY TOLERANCE



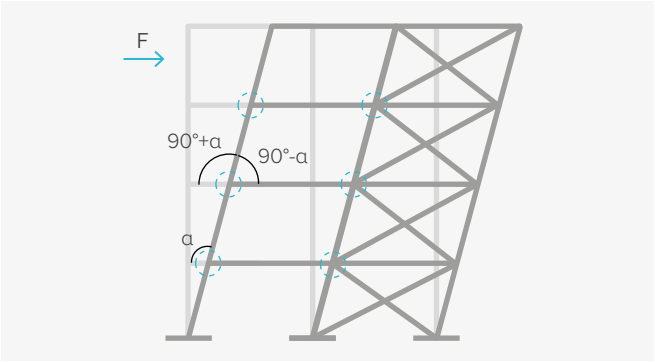
It offers the greatest assembly tolerance of any high-strength connector on the market: δ_{ax} = 8 mm (± 4 mm), δ_{lat} = 3 mm (± 1,5 mm) e Φ = ± 6°.

MODULARITY



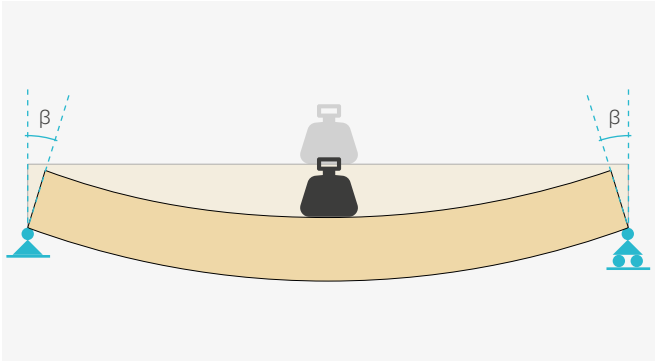
Available in 6 standard sizes (heights); the height H can be changed due to the modular connector geometry. In addition, connectors can be placed side-by-side to meet geometric or strength requirements.

INTER-STOREY DRIFT FOR HORIZONTAL ACTIONS



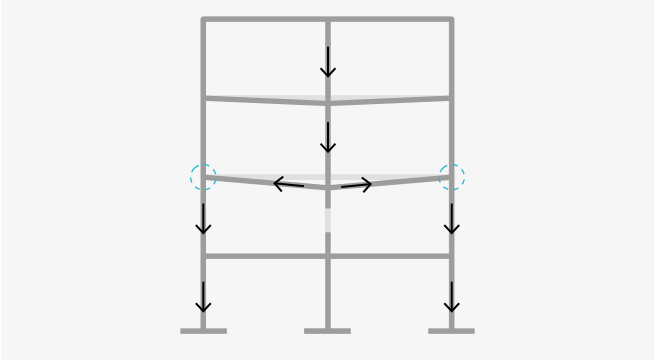
The rotation of the connector is compatible with the inter-storey drift caused by earthquake or wind actions and helps reducing momentum transfer and structural damage.

ROTATION FOR GRAVITATIONAL LOADS



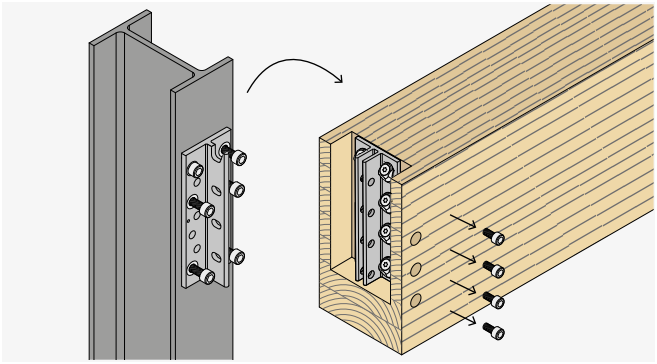
For gravitational loads, the connector has a hinged structural behaviour and ensures free rotation at the ends of the beam.

STRUCTURAL STRENGTH



The connector withstands high axial tensile forces, allowing the catenary effect to develop in accidental situations. This contributes to the structural strength of the building, ensuring greater safety and resistance.

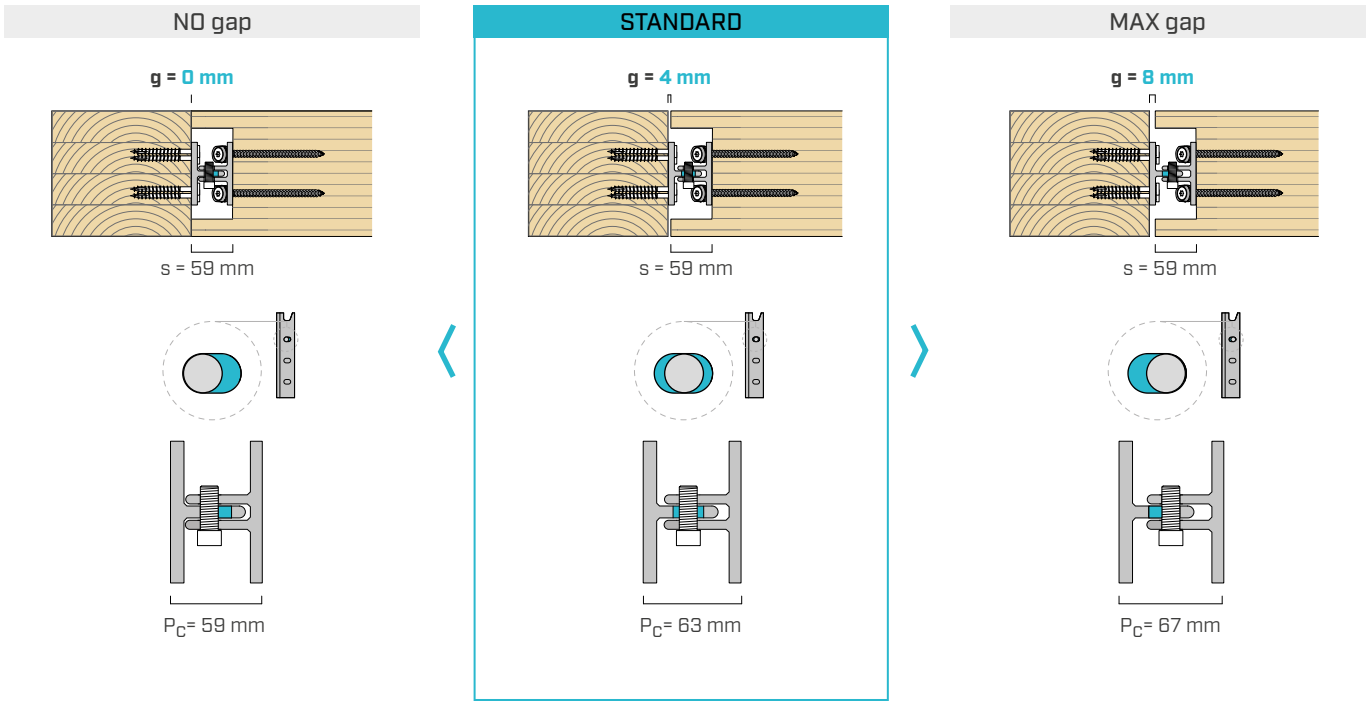
DISASSEMBLY



Particularly suitable for facilitating the dismantling of temporary structures or structures that have reached the end of their useful life. The connection with ALUMEGA can be easily disassembled by removing the MEGABOLT bolts, thus simplifying the separation of components (Design for Disassembly).

INSTALLATION CONFIGURATIONS

The standard configuration for the manufacture of timber elements consists in a nominal 4 mm gap.
On site, a variety of configurations can occur between the two limiting cases: zero gap and maximum 8 mm gap.



If it is required to limit the gap in the construction, for example due to fire resistance requirements of the connection, the depth of the routing in the secondary beam can be modified. As the depth of the routing increases, the gap between the secondary beam and the primary element is reduced and, at the same time, the axial installation tolerance is reduced. The limit case, for which particular precision during assembly is required, is achieved with a routing depth of 67 mm and zero axial installation gap/tolerance.

routing depth s [mm]	assembled connectors size P_C [mm]								
	59	60	61	62	63	64	65	66	67
59	g = 0 mm	g = 1 mm	g = 2 mm	g = 3 mm	g = 4 mm	g = 5 mm	g = 6 mm	g = 7 mm	g = 8 mm
61	-	-	g = 0 mm	g = 1 mm	g = 2 mm	g = 3 mm	g = 4 mm	g = 5 mm	g = 6 mm
63	-	-	-	-	g = 0 mm	g = 1 mm	g = 2 mm	g = 3 mm	g = 4 mm
65	-	-	-	-	-	-	g = 0 mm	g = 1 mm	g = 2 mm
67	-	-	-	-	-	-	-	-	g = 0 mm

Fire resistance requirements can be met by limiting the gap or by using dedicated products for fire protection of metal elements, such as FIRE STRIPE GRAPHITE, FIRE SEALING SILICONE, MS SEAL and FIRE SEALING ACRYLIC.

INTELLECTUAL PROPERTY

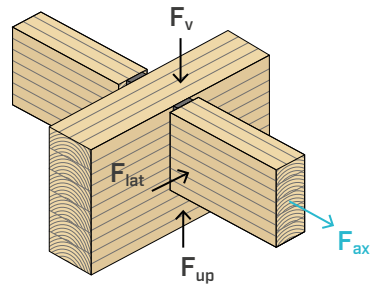
- Some ALUMEGA models are protected by the following Registered Community Designs: RCD 015032190-0002 | RCD 015032190-0003 | RCD 015032190-0004 | RCD 015032190-0005 | RCD 015032190-0006 | RCD 015032190-0007 | RCD 015032190-0008 | RCD 015032190-0009.

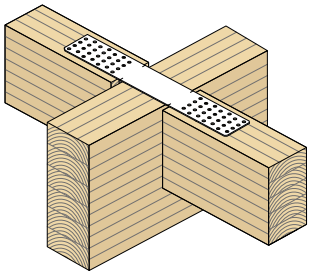
TENSILE STRENGTH

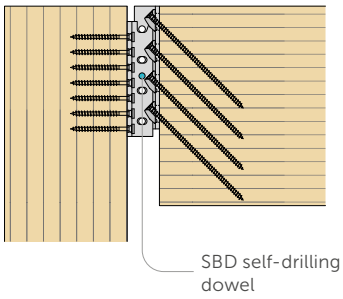
The strength values F_{ax} are valid as a result of the initial sliding given by the horizontally slotted holes in the ALUMEGA HP and HV connectors. If there are design requirements according to which the connection must be able to withstand tensile stress without initial sliding or limited initial sliding, one of the following options is recommended:

- In the case of a concealed connection, it is possible to modify the depth of the routing in the secondary beam (or in the column) in such a way that the axial sliding is entirely or partially reduced. Refer to the INSTALLATION CONFIGURATIONS section.
- Use an additional fastening system positioned at the top of the beam. Standard (e.g. WHT PLATE T) or customised metal plates as well as screw systems can be used, depending on the geometrical and strength requirements.
- Once the connection assembly is complete, a SBD self-drilling dowel can be inserted in the middle of the assembled connectors. It is advisable to pay particular attention to the positioning of the dowel, ensuring that the functionality and capacity of the MEGABOLT bolts and VGU washers are not interfered with and compromised, possibly using a pilot hole.

The proposed solutions can change the rotational stiffness of the connection and its hinge behaviour.

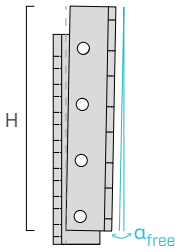


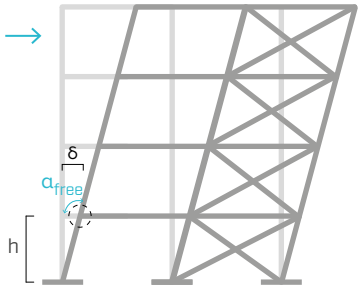




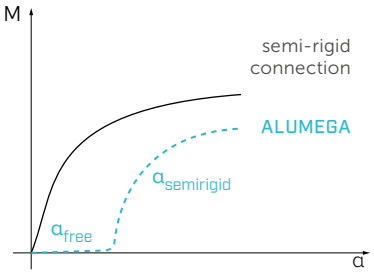
ROTATIONAL COMPATIBILITY

The ALUMEGA HV and HP connectors have horizontally slotted holes, which not only offer installation tolerance, but also allow free rotation of the connection. The table shows the maximum free rotation α_{free} of the connection and the respective storey-drift, as a function of the height H of the connector. The connector, once it has reached α_{free} rotation has a further $\alpha_{semi\text{-}rigid}$ rotation before failure. Rotation $\alpha_{semi\text{-}rigid}$ occurs due to the deformation of the aluminium connector and its fastening.
The moment-rotation graph shows a comparison between the theoretical behaviour of a connection with ALUMEGA and that of a common semi-rigid connection.
For a connection with ALUMEGA, it is possible to assume a first phase, the extension of which is a function of H, in which the behaviour is hinge-like; in a second phase, semi-rigid behaviour can be assumed.
It should be pointed out that free rotation takes place without deformation or damage to the aluminium and fasteners, and that the above assessments are to be confirmed experimentally. See www.rothoblaas.com for updates.

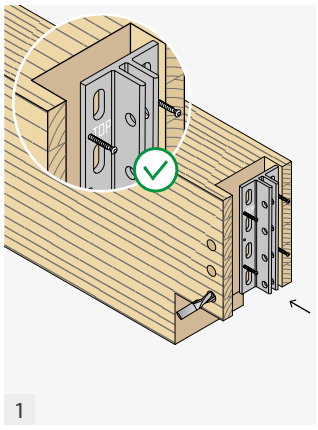




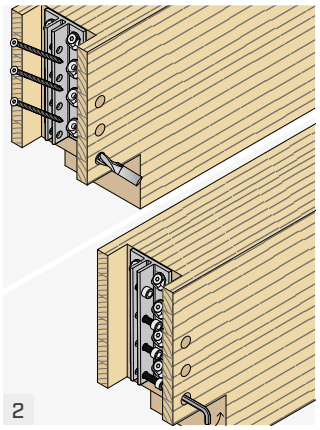
H [mm]	maximum free rotation α_{free} [°]	STOREY-DRIFT δ/h [%]
240	2,5	4,4
360	1,5	2,7
480	1,1	1,9
600	0,8	1,5
720	0,7	1,2
840	0,6	1,0



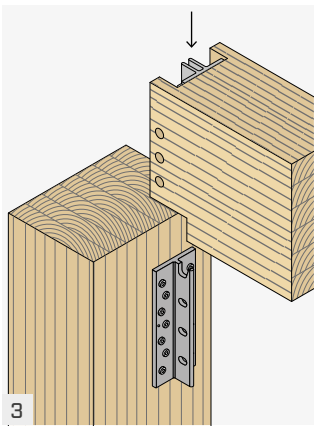
"TOP-DOWN" INSTALLATION WITH ROUTING IN THE SECONDARY BEAM



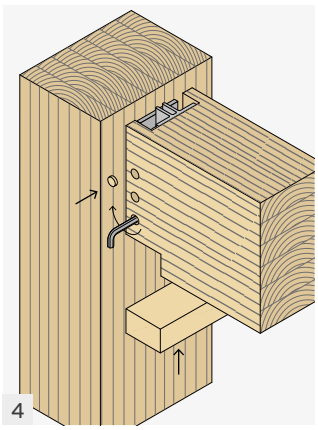
Make the routing in the secondary beam and drill the holes (min. Ø25) for the MEGABOLT bolts. Position the ALUMEGA JV connector on the secondary beam paying particular attention to the correct orientation with reference to the "TOP" marking on the connector. Fasten the Ø5 LBS HARDWOOD EVO positioning screws.



Place the VGU washer in the slotted hole and, using the JIG-VGU jig, drill a Ø5 pilot hole with a minimum length of 50 mm. Install the VGS screw and respect the 45° angle of insertion. Insert the MEGABOLT bolts in the following way: the first bolt must pass completely through both cores of the connector, while the other bolts must only pass through the first core.

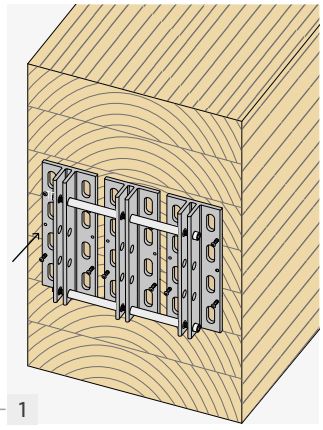


Position the ALUMEGA HP connector on the column, fasten the Ø5 LBS HARDWOOD EVO positioning screws (optional) and the HBS PLATE screws. Hook the secondary beam from top to bottom using the upper positioning notch in the ALUMEGA HP connector.

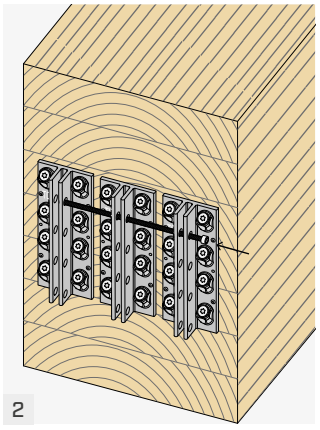


Fully tighten the MEGABOLT bolts with a 10 mm hexagonal wrench.
Place the TAPS timber plugs in the circular holes and insert the closing board, hiding the connection for fire resistance requirements.

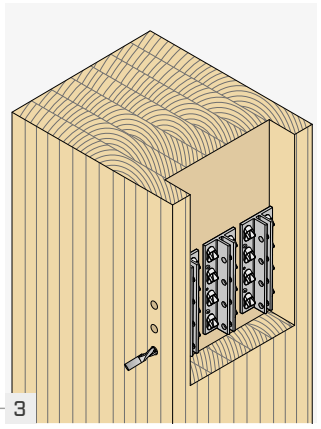
"TOP-DOWN" INSTALLATION WITH ROUTING IN THE COLUMN



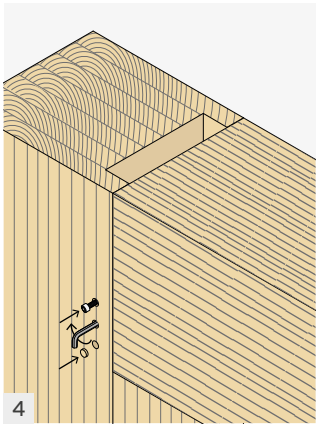
Place the three JV connectors assembled with template and bolts on the secondary beam. Once the Ø5 LBS HARDWOOD EVO positioning screws are fastened, remove the jigs and bolts.



Place the VGU washer in the slotted hole and, using the JIG-VGU jig, drill a Ø5 pilot hole with a minimum length of 50 mm. Install the VGS screw and respect the 45° angle of insertion. Insert the upper MEGABOLT bolt through the three JV connectors.

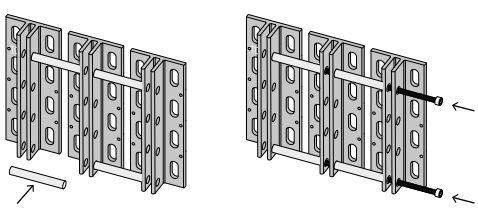


Make the routing in the column and drill the holes (min. Ø25) for the MEGABOLT bolts. Use the jig for positioning the ALUMEGA HV connectors. Fasten the Ø5 LBS HARDWOOD EVO positioning screws. Place the VGU washer in the slotted hole and, using the JIG-VGU jig, drill a Ø5 pilot hole with a minimum length of 50 mm. Install the VGS screw and respect the 45° angle of insertion.



Hook the secondary beam from top to bottom using the upper positioning notch in the ALUMEGA HV connectors.
Insert the remaining MEGABOLT bolts and screw them in completely with a 10 mm hexagonal wrench.

0

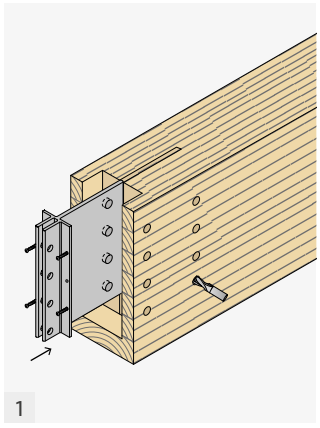


MANUALS

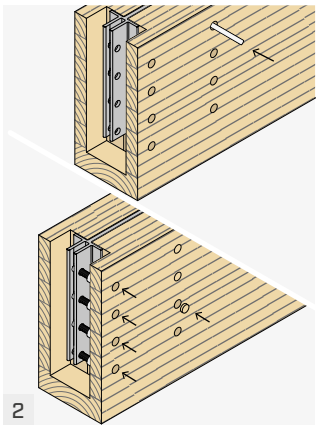
JIG INSTALLATION

Place the JV connectors side by side and position the jigs at two rows of M12 holes in the connectors. Insert the MEGABOLT bolts through the M12 threaded holes, taking care to maintain the alignment between connectors.
The use of the jig for HP and HV connectors is similar, it is recommended to use M12 nuts to avoid MEGABOLT bolts slipping out during installation.

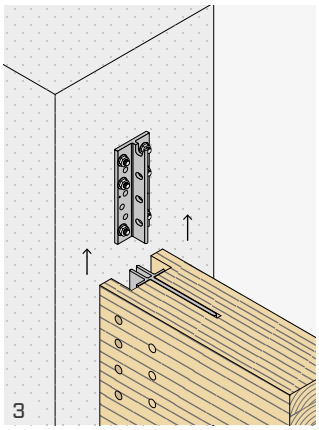
"BOTTOM-UP" INSTALLATION WITH ROUTING IN THE SECONDARY BEAM



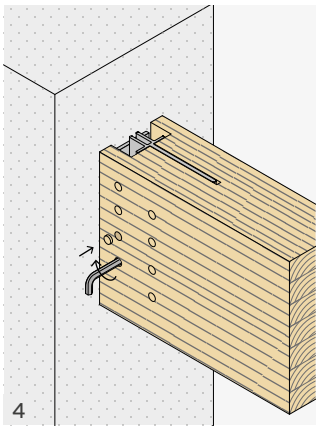
Carry out the routing at partial height in the secondary beam and drill the holes for the MEGABOLT bolts (min. Ø25) and the STA dowels Ø16. Position the ALUMEGA JS connector on the secondary beam paying particular attention to the correct orientation with reference to the "TOP" marking on the connector. Fasten the Ø5 LBS HARDWOOD EVO positioning screws (optional).



Insert STA dowels Ø16 and then close with TAPS timber plugs. Insert the MEGABOLT bolts through the first core of the connector.

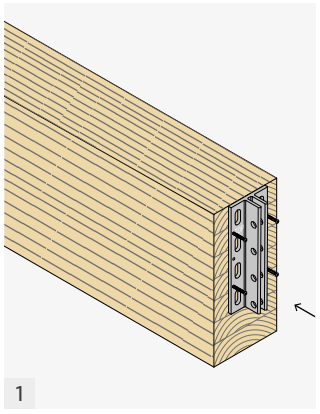


Place the ALUMEGA HP connector on concrete with INA threaded rods Ø12 and VIN-FIX resin, according to the installation instructions. Lift the secondary beam from the bottom upwards, and only screw the upper MEGABOLT bolt fully in when the ALUMEGA JS connector is positioned above the ALUMEGA HP connector.

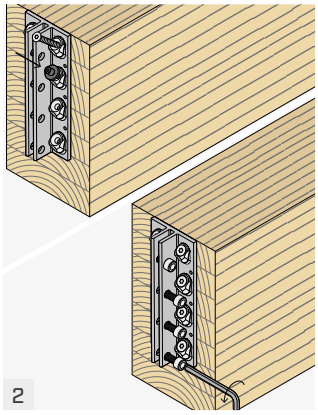


Hook the secondary beam from top to bottom using the upper positioning notch in the ALUMEGA HP connector.
Fully screw in the remaining MEGABOLT bolts with a 10 mm hexagonal wrench and insert the TAPS timber plugs into the round holes.

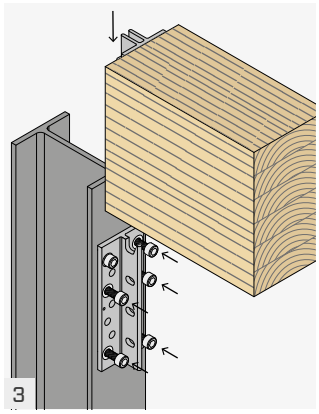
VISIBLE "TOP-DOWN" INSTALLATION



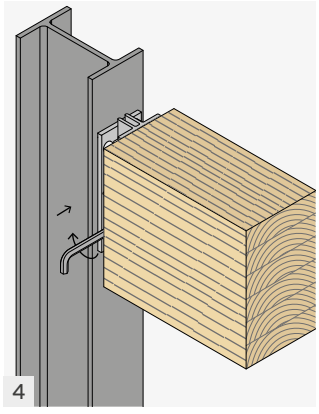
Place the ALUMEGA JV connector on the secondary beam, paying particular attention to the orientation according to the "TOP" marking on the connector. Then, fasten the Ø5 LBS HARDWOOD EVO positioning screws.



Place the VGU washer in the slotted hole and, using the JIG-VGU jig, drill a Ø5 pilot hole with a minimum length of 50 mm.
Install the VGS screw and respect the 45° angle of insertion.
Insert the MEGABOLT bolts in the following way: the first bolt must pass completely through both cores of the connector, while the other bolts must only pass through the first core.



Fasten the ALUMEGA HP connector to steel using M12 bolts and washer, MEGABOLT bolts can be used. Hook the secondary beam from top to bottom using the upper positioning notch in the ALUMEGA HP connector.



Fully tighten the MEGABOLT bolts with a 10 mm hexagonal wrench.
