

8 REASONS FOR CHOOSING A STEEL DOOR

1

**LONG
SERVICE LIFE**

Steel is known as a perpetual material with extreme durability and strength.

By choosing a well-manufactured steel door from DAN-doors, you reduce the frequency of replacements.

This will save you time and money — and reduce the environmental impact of disposing of and investing in new products.

2

EASY TO CLEAN

Steel is a clean,
chemical-free material.

This makes it ideal for use in environments
with high hygiene requirements.

Steel doors are popular in sterile or food en-
vironments where they are exposed to harsh
cleaning routines such as hosing down.

3

SAVE ENERGY

Insulated steel doors retain their thermal insulating properties.

Steel is a strong material that doesn't change shape and properties.

An insulated steel door has several qualities, including the retention of the original construction, and a well-produced steel door will keep its insulation capacity without cold bridges for decades.

4

RESISTANT

Steel can resist corrosion in even the most aggressive environments.

5

100%

RECYCLABLE

Steel is
100% recyclable.

Steel does not lose its structural properties, and a discarded steel door will re-enter the pool of steel and find its way into new applications.

6

FLEXIBILITY

Steel has excellent forming properties.

Steel can be shaped into almost anything with millimetre precision - even in extremely large sizes.

This flexibility provides a good basis for creating customised solutions in all sizes in a cost-effective way.

7

MAINTENANCE-FREE

No need for time-consuming maintenance routines.

Steel is maintenance-free and doesn't require preventative (and time-consuming) treatments for a longer lifespan.

8

INCREDIBLE STRENGTH

Steel is extremely resistant to most external impacts.

Stainless steel is an extremely strong material - even under extreme temperatures.

The strength of steel also makes it resistant to shocks, break-in attempts and extreme weather conditions.
